research this. I'd recommend you read
http://dev-docs.atariforge.org/files/ACSI_DMA_Guide_6-28-1991.pdf
and http://www.atari-forum.com/wiki/index.php/Atari_ST/STe/MSTe/TT/F030_Hardware_Register_
Listing.
I think that all will be answered in these 2 docs.

Good luck,
George

P.S. If you still have questions after reading these 2, I'll try to
help you.

> ...no surprise though, since I used the v4 beta prior to this one :)

Yes, all 4.0-bugs that were reported to me are fixed. There are most likely a few bugs to discover though. One side-effect of the dwindling user base is that it's hard to get enough beta-testers to test new software. When I released Taskbar back in 1997, each beta was downloaded almost 1000 times the first day after it was announced. 4.10b was announced about a week ago, and it has been download 49 times...

So a big THANK YOU to the beta-testers that are still with me :-)

This is a long shot, but I can't think of anything else atm:

In mint.cnf there's a section called NEWFATFS, perhaps your partitions
are not listed there?

I don't think the lack of acitivty here does reflect the number of users, what is does reflect is a move from newsgroups to web forums because people using newsgroups became annoyed at the endless flame wars and spam that you can get in newsgroups bacause the posts and users are not controlled by mederators.

> I have the Atari's "HARD DISK CONTROLLER C103561-001 REV.3".
> On what machine can it be used?

I'm 99%T sure that this is a Stacy/MSTE SCSI adapter. It will plug
straight into a Stacy or MSTE, and can be used on all machines with a ACSI
connector if you fabricate a cable.

> What are the 3 dip switches for?

To set the card's ACSI ID.

Be aware that there are several restrictions on this card:

- Does not have parity, so the SCSI drive must be able to work without.
- Only one SCSI unit can be connected, this must have SCSI ID 0.
- Can not access more than 1Gb.
- SCSI is not buffered, so you must use short cables and NOT terminate the
SCSI drive.

Most of these limitations can be worked around by hacking the hardware,
but IMO it's easier to buy a better adapter.

I haven't used ICD drivers for 15 years or so, so I can't really help on this. If you have four partitions or less you can try AHDI or the demo-version of HD-driver instead of the ICD driver. If that doesn't help try re-partitioning the drive with HDX.

Source record: 3645

Thanks to both of you!

Mark: sorry but I have an Open Mste and it NEEDS that adapter.

So I put it in the machine, and I'm experiencing some problems with the floppy disk:

The HD is a 40Mb Apple (quantum), yet formated for Atari with ICD drivers on it.

- either the floppy is ok but I can't boot from the HD (then HD drivers says: no parition found, I can make a sector test, but no data access)
- either it boots from the HD but then "A: unit does not exist" from the desktop.

What's happening???

Guillaume.

Any more or less recent version works, but you need a CD-ROM driver,
e.g. ExtenDOS pro, in order to access the CD-ROM.

I'd like to use it with a CD-Rom + ZIP. Wich version of HD driver works
with it?

Guillaume.

# 2885. AtarICQ 0.172 is released

Newsgroup: comp.sys.atari.st
Date: 2008-04-16 20:46:47 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <4ac06ea3-605f-4bae-8b77-2c599cb24160@x19g2000prg.googlegroups.com>
Source record: 3653

Hi all,

I had originally planned to wait until this summers NAS (www.sak.nu/nas/) before releasing a
new version av AtarICQ. However, after a rather hard hitting bug was recently discovered and
fixed I instead decided to get a new release out as soon as possible.

The biggest noticeable addition to aICQ 0.172 is the ability to view GIF images as background
in the contact list. This was made possible through a cooperation with PeP, who has been kind
enough to supply a very, very nice OVL that decodes and processes the GIF data. Cheers for that!

A somewhat thorough complete list of changes:

* Implemented support for loading graphics via external load modules in form
of dedicated overlays. (Look into the preferences dialog to set this feature up properly)

* Caching of background images implemented. By default AtarICQ will use a
subdir (/cache) in its own workdirectory for storing the data. To change
this, you need to tweak the cache dir within preferences dialog.

* After loading the GFXGIF.OVL the CPU cache will now be flushed before the client
calls any functions within the OVL. Applies also to aicq.ovl!

* When put in compact mode (F10) the contact list will now use the native
sliders of the AES, including a SIZER widget.

* Clicking the CLOSER widget on contact list while holding ALT-key, will trigger aICQ
to remove the window TITLE.

* More optimised redraws of the TABs, resulting in much less flickering when
toggling between open TABs.

* Cookie jar is now read utilizing Ssystem() under MiNT. Under TOS/MagiC, the
old method is still used.

* Under large gfx resolutions the scrollback setting could easily be defaulting to a much too small value, in case the message window height was
increased. A check for this is now added after reading the config file.
This problem could be noticed as a very serious scrolling problem, causing
aICQ to lock up pretty good.

* In case COLOR_SELECT is not specified in the environment, AtarICQ looks if
COLSEL.PRG is present in its workdir. (This prg is included in the zip file
as of the 0.172 release)

Find the new release on the official AtarICQ website:

http://www.ataricq.org/

Enjoy the new AtarICQ, and please share any thoughts on the new release with me either here or on the AtarICQ webforum at:
http://www.atariforums.com/list.php?25

Regards,

/Joakim

Hi. I'm currently using v8.15, I believe. It works fine with my setup,
Hard drives, CD-ROMs, EZ135 removeable, etc. I think you'll still have
to have CD-ROM software, and I'd highly recommend Anoydyne Software's
ExtenDOS PRO.

Read what Uwe said though, he's da man. :)

Personally I find TeraDesk to be an excellent desktop, but I agree that it's a bit "visually challenged" compared to the eye-candy in Jinnee. However, I don't think a new desktop is what we need now, there's a much more urgent need for some decent and usefull *applications*. Personally I miss the following apps for my Milan:

- An updated and robust emailer.
- A free word processor.
- A good personal organizer.
- Proper SMB support (printer- and filesharing with Windows and unix/Samba).

A good desktop is ofcourse essential, but we already have several that's better than what we find on most other platforms.

If anyone wants to develop a new desktop though, I suggest that it's made modular. Split it into small applications, each doing a well-defined task really well and tie it together using the AV-protocol or similar. This will make maintenance much easier, and it will also be easier to personalize and tune the desktop.

On the subject of Desktops on the Ataris,
I think we already have several good desktops that could be improved.
Geneva and NeoDesk for example would be a good place to start if the author
would not mind allowing someone to do some improvements.

There are many really good pieces of software for the ST-Falcon that could
be brought up to date and or improved upon without having to start from
nothing
to work with. If the author(s) and or owner(s) do not mind.

Hi Dave,

Of course there isn't room for most hardware under the 1040STe shielding,
for most earlier hardware. However I don't let shielding get in the way
of projects.

But I do recall that TOAD Computers use to sell a 16mhz upgrade for the
1040STE, anyone know if this was just a simple 16mhz 68000 square chip
that you just plugged in?

My 1040STE happens to have a Socketed 68000 which was a nice suprise.
Also the chip under the PowerSupply is also socketed.
I've studied the Falcons motherboard, but only recently took a good look
at the 1040STe MB.

I suppose most 1040STe's have these socketed chips, Sure makes it
easier when switching processors.

Too bad about Jinnee, even though I personally prefer Thing. Teradesk
works really well, though as Jo Even pointed out, the visuals aren't
exactly stunning. Neodesk is most probably a no-go, since its'
functionality is too entangled with Geneva (which is very outdated by
todays standards).

Exactly, Neodesk relies heavily on Geneva, and if ran on anything
else, it kickstarts a module with AES-functions from Geneva. At the
end of the day the author has decided not to part with any of his
products - so both Geneva and Neodesk will not have their sources
released.

As Jo Even and PeP already said, Teradesk seems stable and all, but it
is getting clear it will never strive to be more than a replacement
for the TOS-desktop. We have to keep on hoping someone will initiate
an open source desktop project, with the aim to produce a modern
desktop.

Regards,

/Joakim

We could have another option.....Direct desktop by Eric Reboux, i have
never used it, but in the screenshots that i saw together with MyAES
it looked very good.

I remember Zorro author of Zview trying to buy Jinee sources to make
them open source, i read he was very close. I think this happend
before the sources were lost.

Isn't a friendly fork of Teradesk the most viable solution, particularly now that it appears to be clear that both Thing (for whatever reason) and Jinnee are a dead end? As Jo Even says, it's already quite a decent desktop, even compared to the flashy propositions I see on other systems.

If I had a second body and more experience I would port Teradesk to GCC, make it FreeMiNT-only for simplicity's sake (and get rid of legacy code along the way) and implement a plug-in system so that anyone could add functionality with any language they feel more at ease with.

Unfortunately...

From what I remember many updates came in two versions, one for the DIL and
one for the square socket. I know Marius Becroft (hope I have spelt that
right) did two versions of his AT disk adapor. I the the AT Speed 286 chip
also was done in a similar way. Not sure about the Toad. You need to twek
the mother board to double the CPU chip speed, but keep other clocks at 8Mhz
so I would expect that there are multiple mods...

The task of a desktop is to provide functions.
Please leave the fancy stuff to the AES. In casu XaAES.

Personally I consider 3D buttons already despicable bloat.

I prefer Ataris as simple as possible.
Single tasking, ROM AES, as little colour as possible only a light green
background. No 3D. Books arent 3D either.
I use Teradesk because it has better functionality than
the ROM desktop. Thats all.

I worked on XaAES because I wanted something interesting to do.
When I realized that I wouldnt use it myself very much I quitted.

If I want bloat, I start up my Linux box.
I have no urge to prove anything using a 20 year old computer.

Hmmm, while writing this, My TT could run Multics. Even better,
Mulics with a GUI :-)

This is what I wanted to do in 2003 when I revived Teradesk.
I also wrote in an interview that I would encourage people who
wanted something more modern to fork Teradesk as much as would
be needed.

I still believe that the name "Teradesk" should remain being
associable with a simple and compact desktop as it is now.

If you want more, the code is GPL, feel free but call it different.
XA_desk sounds like a good idee.

Djordje, do you agree?

Late in the thread... hopefully I've attributed the words to the right
poster. It would have to be more than just a chip. If the system clock is
8Mhz, that is what the processor is going to run at regardless of what it is
rated for.

Ed

That would be a good idea if someone wants to improve on the existing desktop, but I don't think TeraDesk is a suitable starting point for a modular desktop. I've had a look at the code, and the various potential modules are still too entangled with each other.

If you break down the functionality of a desktop into different modules, each module becomes a very manageable project, and I think it would be best to start from scratch (or perhaps use parts of TeraDesk's code where applicable):

- Desktop: Manage desktop background. Icons on desktop. General set-up. Icon assignment, document type assignments.

- Desktop server: AV-server. Icon server. Put icons and icon assignments in shared memory so each of the components doesn't have to keep and maintain their own copies.

- File explorer: Display a window with a specified directory. Pass the user actions (copy, move, delete etc) to the AV-server.

- File info: Display and change information about a specific file or folder.

- File copy: Copy/move files, using the File info module to do any renaming if necessary.

- Search: Search for file/foldernames or contents. Search result is passed to File explorer for viewing. Possibility to save search criterias/filters, thus allowing "search folders" in File explorer.

Each of these modules would be separate applications communicating with each other through the AV-protocol. The AV-server would then act as a "hub", handing out and passing tasks to the appropriate module.

The AV-protocol is quite suitable for this kind of modularization, and since it's a well known protocol it would be possible to replace a module with an existing or new program if you want to.

The downside of the AV-protocol is the use of pointers to global (if we're lucky!) memory. This causes problems for MiNT's memory protection, not to mention what happens if the calling application crashes after the message

is sent but before the called application is finished processing the string pointed to! A solution would be to replace the string pointer with a shared memory block or a pipe, falling back to the string pointer for legacy applications.

I think that this approach to a desktop has several advantages over a monolithic desktop in a multitasking environment:

- Less bloat. Separating functionality into modules allows simpler code. And stuff you never use is never loaded.

- Expandable. If the desktop server is correctly designed, the desktop environment can be expanded almost indefinitely by configuring the server and adding a new module.

- A better user experience. A lengthy search or copy-operation would never block the rest of the desktop.

- Freedom of choice. Don't like the existing File explorer? Write a new one with ftp-support or whatever.

- And for the programmer: Easier development :-)

I'm not very fond of CAT. I've only tested it briefly, but found the GUI confusing. Too many options for my taste, and too much stuff going on. In many ways it reminded me of Okami wich I used for a while.

I liked aMail, with an integrated editor and a proper address-book it would have been perfect for my needs. Unfortunately it was too buggy to be reliable.

I completely get Henks point of view, even though I don't share it 100%.

I'm getting quite of topic here, you'll have to excuse me.

I'm a tech writer by occupation. The typical technical reader does not want to take part of information, but rather just get on with the task at hand. Sometimes the information itself is pure crap, and I can't do much about it, and sometimes the information is adequate. A big part of the job involves changing the reader's opinion as to increase the likelihood of him/her taking part of the information. If the information was crap, at least he/she read what little there is. If the information was good, the work put into writing it wasn't in vain. I think this could apply to software as well.

What constitutes bloat? Personally I don't think 3D buttons is bloat. It's part of any GUI as to make it more obvious what is buttons and what is not. I don't consider background images bloat either, as it may have a positive psychological impact on the user (an example of this effect is the swedish WW2 command bunkers, where they ended up making fake windows with a painted scenery on the walls. They also adjusted the lighting conditions during the day to reflect that of a typical day outside. As a result, people found it a lot easier to cope with being underground.)

I think a good example bloat-less eye candy is GokMasEs great AtarICQ client. The user interface has always been pretty, yet at the same time very usable and quick. The latest version adds the possibility of having a GIF background image to the contact list (I admit having a certain bias here for certain reasons). On a low spec machine, the process of unpacking GIF images is quite extensive. To cover that situation, GokMasE added the possibility of caching the image in raw (device dependent) format. It is also possible to disable the function altogether. Personally I think that's a good example of providing "modern" candy effects, while still sustaining usability and speed on low spec machines.

Ok, enough of that hippie bullshit. It's in the dreads, you know. As a coder, I already know how things work, and hence I do prefer a fast slick interface. On my Hades however, that slick user interface can just as well be fairly pretty, since the eye candy has very little impact on the overall performance of the machine. Maybe bloat level should be judged in relation to the target system, I don't know.

And now for something completely different...

That depends on what you mean by "fancy stuff" ;-) If you talk about
background images I disagree. The desktop owns the desktop window and is
responsible for redrawing it. I don't want the AES overriding this.

If you talk about semi-transparent icons and fancy icon-titles (yes, I'm
referring to Jinnee here) then I agree. This should be the responsibility
of the AES.

# 2910. How can I get a CF card working on a Falcon?

Newsgroup: comp.sys.atari.st
Date: 2008-04-18 14:05:27 UTC
From: Rob Aries <rob_aries@hotmail.com>
Message-ID: <rob_aries-11FAB0.10052718042008@comcast.dca.giganews.com>
Source record: 3678

Hi All,

I am trying to resurrect a Falcon 030 that has been in my attic for a long time. The HD is toast (click of death). I saw somewhere how a person used a compact flash card to replace his Falcon HD. I bought an IDE --> CF adapter on Ebay and I have an old 128MB card I was using in a camera. My next step is to format & partition the card.

Another search of my attic, and the only such software I found was for my old Link (used with my even older Atari ST). It's ICD software (v6.2.4 IIRC) but works ONLY with Adaptec host controllers. It sees the CF card as "unrecognized unit" on ID #15, then it hangs.

Some online searching and I see the well-regarded HDDRIVER software, however the demo won't format. Since I am really doing all this for curiosity's sake and may not even use this Falcon (actualy it's not even mine), I am wondering if there is any free/shareware options anywhere for making this CF card work. TIA!

I think it was provided with older versions of MyAES. You might also ask
Olivier Landemarre, MyAES's author.

>
>If you want more, the code is GPL, feel free but call it different.
>XA_desk sounds like a good idee.
>
>Djordje, do you agree?

Yes, completely.

Regarding the simplicity- or otherwise:

An important part of my concept when I first took part in TeraDesk project was that it should remain compact and simple. Many times there arose a situation where I had to weight the benefits of adding some option against the increase of code size and memory usage, and increased complexity of use. It seems that people using more capable machines tend to forget that there is also a number of users with feebler Atari machines who find that TeraDesk, as it is now, exactly satisfies their needs. They would have no use of marvellous desktops needing X megabytes of RAM and XX megabytes of disk space. As there were already two other desktops targeted at capable machines, I think it was a good decision to provide a new one having in mind primarily the feeble and the poor :) - therefore it was clearly said, when TeraDesk 3 was released, that it was not intended as a replacement for Thing and Jinnee.

I would also like to point that the (good-natured) objections raised here against TeraDesk appear to concern the cosmetic side mostly- not the functionality. There seems to be a general agreement that TeraDesk does what it is supposed to do, reliably. And yes, I agree that the code has become tightly connected and there are some legacy segments in it, but it is all in the function of fulfilling its purpose and design concept.

Btw. some things should remain simple. I think that there are rising issues of visual appearance of GUIs, icons etc. (on any operating system) that will have to be discussed soon. How standardized should they be? How complex can a display become before it becomes umanangeable by human users, whose brains do not double their processing power every couple of years, as CPUs do?

Imagine that one is driving a fast car and comes to a traffic sign warning of a dangerous bend ahead (a simple three-colour triangular icon). Would the message be better and more quickly understood by the driver if, instead of the traffic sign, there was a magnificent truecolor photograph, in 8000x4000 resolution, of a pile of crashed cars, on which one could read

evey number on license plates, recognize the members of salvage teams caught in the scene, and read the logos and advertisements on cars of media people present?

(a question: why would anyone need a truecolour desktop icon?)

Regarding the naming of names:

In order to avoid confusion, it would indeed be better to create a new name for any significantly different new fork, and leave "TeraDesk" name (btw. I never found out what was this supposed to mean) to the current fork.

About development of a new desktop:

It is all very nice, but I would like to say a few words of warning:
I joined TeraDesk project several months after Henk revived it. It took us almost a year to overhaul it significantly and create TeraDesk 3. Since then, a number of things were added, problems fixed and it took more than four years to get it to its present status (and there are still some improvements to make- a new bugfix release is due soon). I am afraid that if a new desktop project is started, by the time it reaches a really usable state there will hardly be any users left (or even left alive).
We have an example of "Direct" desktop with nice visual effects but relatively poor functionality that was abandoned soon after initial release.
We have painfully slow advances e.g. in Highwire (is it still developed at all?) and even in XaAES (when was the last relase?).

There was a general once, who said something about having good ideas today, against excellent ideas tomorrow...

regards;

Djordje

Btw. there has recently been an inquiry by a user about a possibility
of compiling TeraDesk so that it could be burned into ROM (Flash EPROM,
to be more exact). He built a circuit containing TOS in the Flash,
there is more than enough free space above TOS at $E00000, and the
Flash can be simply reprogrammed with any update...

> some improvements to make- a new bugfix release is due soon). I am afraid
> that if a new desktop project is started, by the time it reaches a really
> usable state there will hardly be any users left (or even left alive).
I understand your point of view but I tend to disagree here with you.
I think it's all about motivation. For example: I really missed some
good GEM, clean, opensource music player. I didn't know one single
thing about GEM programming. After 3 months I was able to release the
first version and I really don't think it was some unusable alpha, it
wass fully working one and I think it looks and behaves good and has
many cool features never seen on other atari player. After that there
was one bugfix release and... since then, I don't need more (meaning
bugfixes, new features can be always added ;).

I want to say, desktop is clearly more complex project but not
impossible to code. With my current experiences, the first version
with the same (plus minus) functionality as Jinnee/Thing could be done
under 6 months of intensive development. After one year well used,
bugfixed one.

I think this kind of desktop will also use much much more users than
TeraDesk since users want nice GUI, "useless" features, truecolor
icons etc... Try to ask Falcon / TT / Aranym / Hades / Milan / CT60
users how many of them are using TeraDesk and how many of them are
still using Thing/Jinnee...

Summary of this my crappy post is there's no point in discourage
coders from creating new cool desktop. I really can't do this, I have
so many atari projects open... this would be suicide ;)... but someone
else... may be still hiding and we're going to see some surprises ;-)

> (a question: why would anyone need a truecolour desktop icon?)

Because an icon designed in a modern graphics application with gradients, Gaussian blurs or transparency looks like crap when converted in 256 colours, let alone 16. I know that from experience. It removes much of the fun of creating new icons. Drawing pixel by pixel in Interface may be courageous, but not everyone is a masochist.

So, the user may not *need* a true colour icon, but the artist *wants* them because they make it's work easier. Now don't ask me why would anyone need gradients in an icon :-)

The CT2 use the MMU to map FastRAM, so I doubt that Outside will work.

I'm pretty sure I got it working on my CT2B. I'll have a look tonight
and see if its still installed. I have 64MB fast ram anyway, so never
use it;-) All that's required is a 030 or better iirc.

It depends on the translation tables. If the mapping is similar to the
one used by the TT TOS it might also work for the CT2.

>bugfixed one.

This is too optimistic, IMO. Development time for a new desktop would
probably be similar to what it was with previous desktops (Thing, Jinnee,
TeraDesk...) and other large projects like AESes, web browsers, etc.
They are all created by human beings who can only do so much in 24 hours,
and who, no matter how motivated, also have a life beside coding new
software. So, my estimate of development time for a good new desktop
is at least a couple of years.

>Summary of this my crappy post is there's no point in discourage
>coders from creating new cool desktop.

I did not want to discourage anyone. On the contrary, I want to encourage
anyone to produce something better, but I am trying to be realistic. Myself,
I would like to see a new open-source deskop appearing, if only to compare
design approaches with what I am doing. I will probably still be around a
couple of years from now. And if it happens that such a new desktop suits
my needs better then TeraDesk, I would be willing to switch.

>I really can't do this,
>[...]
>but someone else...

This is an illustration of the problem. We all see that things can be
better, but we also have other projects, other interests, other obligations...
If only someone else could produce in a flash what we imagine...

E.g. I would really like to rewrite large parts of TeraDesk- some
legacy routines are so entangled that it is difficult to comprehend
all that is happening inside them, and why they were designed that
way and not differently. I would also like to adjust the code so that
it is "compilable" both in PureC and GCC. The idea of modularity is
also a very interesting one. But I probably can not afford so much time
and effort.

>I think this kind of desktop will also use much much more users than
>TeraDesk since users want nice GUI, "useless" features, truecolor
>icons etc... Try to ask Falcon / TT / Aranym / Hades / Milan / CT60
>users how many of them are using TeraDesk and how many of them are
>still using Thing/Jinnee...

Yes, I suppose that a majority of such users are using Thing or Jinnee, but most probably a majority of users working on low-end Atari machines are -not- really using those desktops. Now, we are all striving to keep alive and usable a 20-year old computer family, let's say as a part of the technical and cultural heritage of the informatic society (and also because it is fun). In that context, a usable 520 ST is as important as a Falcon or a Milan. They need not run same software, but they should all run good software.

Be sure that I do not encourage anyone to switch to TeraDesk from Jinnee or Thing. Those are nice desktops (Thing appears somewhat limited and chaotic to me, though), and whoever finds them suitable should continue using them.

>anyone need gradients in an icon :-)

The last sentence/question is in fact the important one. What an artist
likes is irelevant. What is relevant is that the interface is convenient
-to the user-. Icons or whatever other symbols are used to communicate with
a computer should be simple, quickly readable by the user, standardized
and possibly human-language idependent. Use of gradients, blurs or
transparencies seems to me to be counter-productive in that context. The
"icons" need not be the likenesses of anything- just easily recognizable,
difficult to misinterpret, graphic shapes. A set of highly-stylised
Chinese-like or Egyptian-like pictograms comes to mind.

OT: for a long time we were taught (more-less) that pictographic writing
was used mostly by "primitive" societies early in human history, and that
it was made obsolete by the invention of phonetic alphabets. Lately, we are
seeing a significant revival of the use of pictograms, which prove to be
more convenient when it is necessary to convey instantly-readable messages,
or communicate across language barriers. On the other hand, increased
use of pictograms, together with increased graphic power of computers
and telecommunications devices, seems to indicate the onset of wide-spread,
computer induced iliteracy- fewer and fewer people will want to actually
read or write anything and a richness of words will be gradually lost.
I am not sure that humanity will benefit from such development.

This appears quite reasonable. I would like, however, to raise one more issue related to this division of labour. It concerns the fileselector. Generally, it is embedded in the AES or else a discrete application substituting the one in the AES. It is expected that a good fileselector has provisions for diverse formatting and displaying all kinds of file and folder names, masking or sorting them by diverse criteria, calculating total and selected sizes, scrolling file lists, possibly handling drag & drop, etc. Some selectors can also perform file operations like deleting or copying (let's ignore for the moment whether they should do so)...

Now, this functionality requires a considerable amount of code. A desktop needs all that code anyway, for the file explore/copy/info part, but fileselector is not a part of the desktop but of the AES - and an AES needs very similar code only for the sake of the fileselector- and then it is likely that its behaviour and appearance will not be identical to that in the selected desktop. This duplication seems to me to be a terrible waste of effort and memory (both in the human and the machine). It would be good if a solution were found to have the relevant processing provisions only once in the system, to be used by whatever needs them.

(generalized, a fileselector appears to be in fact a directory window, with provisions added to manually enter a filename).

Very true. Icons have indeed evolved from actual pictograms to small,
pretty pictures mostly used for decoration.

It could be done already now if you're using N.AES, which has a clean way
of installing a separate fileselector. The file-browser could then be used
as a fileselector as well. I'm not so sure that you'll gain much in terms
of memory, as there probably will be some overhead in the code to handle
the two modes. But if it's properly designed it will enhance the user
experience.

This is only your opinion, and it is not that of, say, Apple, which is
held nowadays as the be all and end all of interface design -- a view I
don't share myself.

What I meant to say is that by allowing true colour icons you allow the
guy/gal who will actually do the drawing full control over it's
creativity. By limiting the display to 256 colours you don't. Liking or
not liking what he/she does with the 16700000 colours at his/her
disposal is just a matter of opinion.

Hi guys,

Firstly, sorry for going off topic like this, but I figured some of you might wish to help a fellow atari user out! ;)

Me and some of my buddies from work joined a competition between different work places in our town. The whole fun consist of ppl normally not being musicians performing a set of 3 songs. Now, we did not make it to the final directly, but with some (a lot of it, actually!) help we might have a shot of winning an online voting - which would give us a wild card to the finals :)

And voting ends on April 30th....

Feel like helping us out? Please..? :)

If so, go to this page and scroll down to the bottom of the page and select "First Clas" in the submit form, and then press the button named "Rösta".

URL: http://www.pitea-tidningen.se/tavlingar/kompledig.aspx

Now, vote away! And by all means, tell your friends (and their friends) to lend a hand too!

Thanks in advance!

Regards,

/Joakim

N.Fsel hooks into N.AES using a clean interface. I'm not sure if it's
documented anywhere though.

Hello,

Is there someone running MagiC! / MagiC-Net who could set up his
files so the EtherNat can run ?
Despites everything I tried, the best I could obtain are 3 bombs
and computer hang when accessing the board at boot.
What I did : copied Ethernat.xif to Ethernat.mif into the Xtension
folder, created the inf file with the mac adress of an isa board
in the same folder.
Unfortunately, that doesn't work. :-(
Must I add something into the inf file ? I assumed it would use
the magx_rc.net file, but... would I happen to be wrong ?

Regards,

J.-Luc

# 2947. P2AM -- PS/2 mouse for every 16/32-bit Atari and Amiga

Newsgroup: comp.sys.atari.st
Date: 2008-04-24 18:36:11 UTC
From: MiKRO / Mystic Bytes <miro.kropacek@gmail.com>
Message-ID: <435ab83d-d5da-4704-9c3d-0c4329d37f16@27g2000hsf.googlegroups.com>
Source record: 3565

Dear Atari users,

once again, we have some nice stuff for our beloved machines. We've got tired by fixing old Atari mices, "spamming" recent Atari dealers / hardware makers if they really are out of stock with Atari mices and/ or converters for connecting some recent (PS/2, USB) ones.

Fortunately (for you ;) we have made a decision to produce own batch of hardware. What is this all about? Yes, we're going to produce completely new batch of PS/2 adapters for every Atari 16/32-bit computer! You can use any PS/2 mouse and connect it to your Atari. No need for soldering or changing the original case -- everything fits into nice little box connected by thin cable directly to your mouse port.

In case you already owns our previous piece of hardware -- SatanDisk -- you're aware of the fact we mean it seriously, you can count on quality, good support and communication and mainly -- damn fair prize! One PS/2 converter (we call it P2AM -- as PS/2 to Atari Mouse) will cost you only 15 Euros! Compare that prize to PeST or any other PS/2 converter...

But we're not done! Not only you can use this device for your Atari but in case you own also our enemy from the past (read: Amiga ;) you can use it here, too!

And finally, you can ofcourse buy (nearly) any of that fancy USB->PS/2 converters and connect USB mouse to your Atari in this way!

Since the SatanDisk production we gained also a lot of experiences and got quite a feedback from you, users, we've completely remade our "business websystem", you're going to be damn surprised how friendly and professional looking is now ;)

One last note: there wont be pre-order phase. So please take a very good look, when is the deadline for payment shipping. After this date we can't guarantee you will be able to buy anything. And of course, please, tell all your Atari/Amiga friends about this, you wouldn't believe how very late we received some requests for SatanDisk availability... be careful this time! ;)

Hello J.-Luc,
I have a full working MagXNet system complete with Iconnect, Gluestik/Sting, Draconis and of course MintNet. While I am of course not the programmer of this very nice internet stack that brought everything together from years of multi internet stack programs. I am somewhat of an expert in setting this stuff up. My EtherNat's are on their way (yes I bought two). First thing I see, while I am not sure that it matters, is that you renamed Ethernat.xif to Ethernat.mif. Not sure that it is critical of the name of the first part of the filename but you never know. Mine is named ENEC6.MIF. Try rename it from Ethernat.mif to ENEC6.MIF and of course make sure it is in the XTENSION folder under Gemsys/Magic directory.

What is this inf files name that you speak of??? If it is the magx_rc.net file that you speak of. Then it needs to be in the Gemsys/Magic/Start folder not in its current location which you speak of which is xtension directory. If its some other file that you have created I am wondering for what purpose when it is not required any other files than what came with the MagXNet files. Now I think there may need to be some tweaking of this Magx_rc.net file, since it makes reference to en0 when (correct me if I am wrong MINT users) Mint uses NE0 as references to the ethernet adapter. Have to read up on it and see if this is the case. Just my two cents hope it works!! Then we can have a MagicNet setup working on EtherNEC.

Enec6.mif is the driver currently used by my EtherNec.
On their site, Nature provide an archive containing the driver for
MintNet, which has a xif extension, so I renamed it mif, as I did
for the EtherNec's one.
But, what was working for the EtherNec doesn't for the EtherNat. :-(
Moreover, I can't figure in what changing the name from Ethernat.mif
to Enec6.mif could help making things better : the important is that
the driver, whatever its name, is at the correct place, isn't it ?
Anyway, I tried to check the bits of the driver (fastload, etc.),
and found that it isn't recognized as an executable... :-/

In the readme into the zip file, they say to create a file at the
root of the system disk with a mac adress, and rename it to
ethernat.inf - what I did -.
They say too that the board must be referred to as en0 - just like
the good old EtherNec! -, and that the cable must be plugged at
startup in order of the board to work.
I don't really mind to run Mint, except it might slightly slow down
my machine. :-/

Was not sure that that would work. Right now you are trying out
everything that I would be attempting to do if I had my EtherNAT. So
until I get mine I am hoping that I stumble onto something with you that
causes the EtherNAT to work.

Root of the system disk hmmmmmm..... Would that not be C:/ drive???
Not in the same directory as the Ethernet.mif???? Well then the en0
thing is rather encouraging. That means that all the files that MagXNet
uses will not have to be changed to refer to anything other than en0.
Let me pull the documentation off of their web site for the EtherNAT and
see what I can see.

Hope I can help with this.

Hello,
I forgot to ask this but I guess I also assumed that your MagicNET
setup works fine under Magic with the EtherNEC??? The only thing
obvious that I see without looking further at your setup is that you may
have put the ethernat.inf file in the wrong place. I hope this helps
you (and me as well).

Hello Carey,

Yes, my EtherNec config works fine. :-)
About the EtherNat.inf, I tried with it at different places, including
Xtension, Home, and C:\, and always the same behaviour. :-(

Well my next suggestion would lead me to believe that there must be a
way of telling MagXNet that the MAC address has changed. I would say
that we need to investigate all files with MagXNet and figure out how
and where it is looking for the MAC address. Since it is probably
looking for the EtherNEC instead of the EtherNAT. At least this is
what I am hoping. I am not in front of my computer at the moment.
But I will look tonight and see what I can see and report back any
suspicious areas that may help us to get this to work.

# 2955. [WEB] LInks Atari Web Browser SpeedoGDOS

Source record: 3573

Hi,

Now Links can load and use externel SpeedoGDOS fonts, it's faster, for
more informations for activate it:
http://aniplay.atari.org/links/index-e.htm
http://links2.atari.org is created but actually not active.

Direct link for the archive (sources, rsc and prg):
http://didier.mequignon.free.fr/files/links-2.1pre33.m68kgdos.tgz

This update works under MiNT and also under MagiC (screenshots are under
MagiC) since fork call are removed, but I cannot use get a connection
with MagiCNet.
VA protocol and drag & drop are supported.
Background window redraw faster.
"connection would bock" problems are fixed.
Icon bar redraws on multiple windows fixed.

Regards,

Didier.

I don't think it works this way.
In fact, I'm quite sure it depends upon the driver to tell the
system to use a device hokked to the rom port or the expansion
one.
In the case of the EtherNec, the driver is built to act through
the ROM port, while the EtherNat's one tries to access the
expansion port.
So, it would be of no use to try and tweak anything regarding
the MagxNet config.
The solution would be, since MintNet was updated unlike Magx-Net,
that someone installs a Mint/MintNet config up-to-date at the time
Magx-Net was brand new, and recompile the driver so it could work
with our outdated Magx-Net setups. :-/
Or, even better, if someone could get hold of Magx-Net sources and
update the system - dreaming is free, isn't it ? -. ;-)
BTW : the EtherNat has resurrected the "plug'n'pray" days. :-(

What kind of Atari are we talking about? I would either go with a DaynaPort
SCSI Ethernet adapter (hard to find) or else the NEC2000 which is an ISA card
that hooks up using the Atari's cartridge port (what I use right now).

>> I first typed it (hex code) with my fingers on a Sinclair ZX in 1981.
>
> Yes me too. The code was in a magazine in GB, probably "Your Computer".
> I might still have it somewhere.

For me it was in the "L'Ordinateur Individuel" still existing as a
French computer magazine, so long time since this good old year 1981.

I still have the Sinclair ZX that I bought, but it is broken and
doesn't boot anymore, with its 16Kb RAM extension. I also keep plenty
of recorded tapes with the programs I've written at this time (from
1981 to 1986). It will become unreadable one day if I don't care
for these ... But I don't have the corresponding tape recorder (UHER)
unfortunately. It'll surely disappear from the magnetic tracks.

Thanks to the Breakout Game, I learned the Z80 assembly machine language
(almost similar to 8085 I discovered later on with HP computers) with
the book of Rodnay Zaks <http://en.wikipedia.org/wiki/Rodnay_Zaks>

So I first started enjoying computing thanks to Sir Clive Sinclair, with
the game that was originally created by Steve Jobs and Steve Wozniak
when they were both working for ATARI Corporation.

It is noticeable I didn't start with "10 PRINT BONJOUR" but with
"10 REM C64A59B22D ..." or something like that ... Pretty complicated !
Because ZX81's thermal printer was almost unreadable in the magazine.

Do you know if any ZX81 emulator would have ported this Breakout Game ?

Best ATARIan regards,

Yeah man! Speed increase is dramatic!

It does get the hickups here and there and blocks the system, but it's only a matter of waiting a couple of seconds and then it's fine again. While it doesn't quite rival Highwire in speed yet, it's not that far behind either.

Again, great work, Didier.

I could be wrong, but I remember some talk about this interface and the
advantages of it. However, when I look in the docs for N.AES and N.Fsel
now I can't find anything about it. SO I'm probably wrong :-)

Thanks a lot for your efforts Didier. I am glad to have a browser on my ATARI that is capable of Javascript and SSL. Unfortunately on my Afterburner equipped Falcon with NOVA graphics card (1280x1024x256 resolution) both versions of Links are very slow. Especially rerendering when changing the window resolution takes a lot of time.

Perhaps I did something wrong or is it just the fact that the Afterburner is so much slower compared to ct60?

Regards,

Frank

Hi Uwe,

IIRC, I have version 3.20, I'm not at my software storage ATM so that
may be the wrong version number.
I'm actually outside at the moment. 8-)

Anyhow, When using OutSide on a Stock Atari such as a 1040STe or
Falcon 030, will the software keep up with software/hardware packages,
that allow Video and/or Sound Digitising?

That's the main reason I'd like to use it, so that I can Grab very long
Video and
Audio Clips.

Source record: 3593

I found what I think will work.

I had forgotten that I bought several adapter boards a few years back.
Found them while looking at my Panther Graphic board adapters.

Which now I believe were made for the MegaST, due to the long
68000 empty socket on them with pins for a long 68000 socket
on the other side.

Adapter Boards...
On one side is a socket for the long 68000, and on the other are
pins configured just like a square 68000.
2 of these boards are from Compo and the other 2 are GE Soft from
Germany. All of them look the same except for the color.

I have a Fast Tech. 16mhz upgrade (long 68000). That's switchable
between 8mhz/16mhz. But it does require a power source. Think it was
made for a Mega ST.
So hopefully, I just have to plug them all together in my 1040STe.

I suppose this is what these boards are for.
Does anyone recall any other hardware upgrades for the MegaST or etc.,
that connected over, or in place of a long 68000?

Maybe using one of the adapter boards I could get a Panther working
in a 1040STe which would be nice. Of course the shielding would have
to be modified, but I think it will all squeeze in there.

I had my MegaST4 socketed so it would accept an ICD AdSpeed and a TEC card to add TOS 2.06. Connected the TEC card so TOS was switchable. Geeze that was a long time ago. Seems like the AdSpeed was on the original CPU and I didn't go to the socket until adding the TEC card.

I had a PC Ditto2 on the CPU for a while too. I was one of the lucky ones that got it working. Unfortunately lost interest after discovering it was only 4 color.

AFAIK everything was made to fit the CPU so they could be used on the standard ST too. Megabus connector is still a virgin.

Could the boards be an adapter to use a square CPU in the MegaST/ST? Seems like an adapter like that was made. Don't recall details or even for sure.

# 2977. Videomaster Falcon

Was wondering if anyone has attempted to upgrade or modified this software.

I would like to have a Converter program, that will convert the Video and
Audio
files made with the VideoMaster Falcon cartridge and also the ST/STe/Falcon
VideoMaster Cartridge into popular modern video/audio formats, or at least
one or two of the older formats like .AVI

Also a Converter for Video made with Vidi ST and Vidi ST 12.

It would probably be possible to do that with these boards, but they would
have to
be modified/ fitted with a couple rows of pins and a socket for a square
CPU.

As is there is just a plain socket for the Long CPU and very small pins for
the
Square CPU. It looks like one leaves the Square CPU in place and inserts
this
board into the socket overtop the original CPU.
There are no componets on the boards, not even a resistor.

According to the dates, they were made in 91/92.
Maybe they are just various project boards?

This depends a lot on how this software actually works, you should give
it a try.

If I remember well what I've done... M_Player is able to load a Video Master film an replay it... Now, I can't remember if I added the support for disassembling such videos into images files that you can then re-assemble into AVI, MOV.

M_PLAYER is also able to convert a video on the fly: but with a very ugly way that only a basic TOS can support.

Guillaume.

you're right Peter, no way. however, i've got strange idea when i was reading this -- what about tracking cvs changelog for mintlib and to look, where those changes occured? then it would be (in theory) possible to do 2 things:

- disassemble magicnet and to find that bad offsets and replace it with the right ones (better, but harder solution)
- compile ethernat.xif against this archaic mintlib and run under magicnet (easier but not good for future development)

i think it isn't much work (better said, it's more dull than much work), question is, if it's really worth that troubles... much better would be to code super-user-friendly GUI installer for FreeMiNT for letting users to discover this world (which has some future...)

Bonsoir

As always, download on my webpage, or directly in the folder:
http://rajah.atari.org/files/ -> kkcmd10b_uk.zip (90KB)

If you don't know about this program, it's a shell ï¿½-la-total-commander,
very very basic. Can run in ST monoTOS 320*200, or under MagiC with long
filenames.

News:
- MiNT Memory Protection compatibility (no more crash at start, at
least. remove of RESERVE at initialization)
- remove of LPEEK for TOS detection (use of GEMDOS version)
- some minor changes in the RSC for ergonomic purposes
- mouse button right click = click on the "~" button

So it seems i have found how to produce .prg MiNT MP compliant. Please
tell me if it works correctly under you hard-core user mint computer.
And i will fix/update my other programs.

Voilï¿½

Mark was looking at this program at the last club meeting; he tried the
"move" option to move a file from one window to the other, but the
original file remained after the operation. This would have been with
the previous version, and using MagiC on a souped-up Falcon.

# 2988. Falcon Clock Chips and STOS Falcon extension

Newsgroup: comp.sys.atari.st
Date: 2008-04-28 08:27:31 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <fv41pg$8r8$1@gemini.csx.cam.ac.uk>
Source record: 3506

Hello,
I now have some Dallas DS12887 Falcon NVRAM/Clock chips in stock, you can find them on the hardware page of my website at http://www.sgmelectrosoft.co.uk.
Price is £7 each including postage and a socket (chip and socket together may not fit in standard Falcon case), I am selling to UK and Europe only as I suspect that with additional postage cost and the exchange rate US Falcon owners can find them cheaper locally, if not e-mail at the address on the website for prices.
If you are an Atari dealer and want to buy in quantity e-mail me using the address on my website for prices.

Note: People belonging to Cheshunt Computer Club should contact Mark Branson in the first instance as he has already secured a quantity of clock chips for club members.

A register verion of the Falcon STOS extension by Anthony Jacques can be download from the software page of my website.

Stephen Moss

Perhaps the "atari" way:
- dragging a file makes a copy
- dragging a file, with key Control pressed, makes a move

I tried to reuse the key shortcuts/behavior of the TOSdesk and Magxdesk,
not those on PC.

Regards

Pierre

The MagiCNet developer - did he loose the source code? I mean,
couldn't it be updated to match 7+ years of development? :) (well - or
- patched to keep up sort of :-).

> i think it isn't much work (better said, it's more dull than much
> work), question is, if it's really worth that troubles... much better

> letting users to discover this world (which has some future...)

Indeed. Too bad if people are discouraged because they *think* it's
difficult to use freemint just because of slightly trickier
installation procedures.

Good point. Why else would you want a high-end machine if not to take
advantage of its features?

> Summary of this my crappy post is there's no point in discourage
> coders from creating new cool desktop. I really can't do this, I have

All development is good for the platform. It's better to have
"something" instead of "nothing". Then again, I might think
differently when people want to re-invent the whole concept and write
a new OS or something, but that's another story. We need applications,
desktops included.

I am no programmer for the Falcon I have to admit or I would do it
myself and release the sources to all for further development. I
might be interested in learning. But time does not permit me to do
this very often. Really what is needed to do what is being asked??
Really all Magic users are not asking for the world here. Just to be
able to keep using there machines as they were.

>

I have tried and tried and tried contacting him over and over for the
last 2 years or so and have not gotten any response. I am sure all is
possible but with a software developer that is not able to be reached
it is impossible to get this done.

>

I am currently running 3 OS'es Magic, Mint and TOS. So this is not
the issue. I want to remain able to use all my hardware and software
without having to change everything around to be able to use Multiple
OS's.

Honestly how hard is either of these to do?? I would be willing to
learn if someone can teach me all of this. And at some point I could
take this MagicNET even further. Is anyone up to the challenge to
teach a novice. I do have 8-bit atari programming experience. This
would certainly be a learning experience and as small as the MagicNET
driver is at 3-4 KB might be the exact thing needed to get my feet wet
into programming on the Falcon. What kind of tools are needed to get
this job done?? Let me know and I will keep up my end of the deal by
downloading necessary tools and programs needed to get the ball
rolling. Who knows if I catch on maybe some cool new stuff may come
out of my computer for everyone's enjoyment.

Thanks,
Falcon060

I think this is most a "communication" problem : at the time orders
were made, it was that the MiNT driver would work on MagiCNet, just
the way the driver for the EtherNec did.
Unfortunately, MintNet was updated while MagiCNet didn't.
I never read on Nature's site that the only supported environment
would be MintNet. I think, if that had been, people wouldn't have
stood still, and maybe a solution - else than "use MintNet and shut
up!" - would at least have been on its way, unless found.
Yes, since 2 or 3 days, I know that had been discussed on dhs forum.
But I didn't knew about it before, and as most of the buyers, I would
have expected some relay on nature's site. :-(
The reason why I'm not angry - despites whatever you could imagine -
is that I understand it's an amateur (opposite to commercial) project,
that they brought on their free time - and I know too well what free
time is worth! -.
But, once again, something like "Hey! guys, there's a problem with
MagiCNet! who can try and see it ?" on the main groups would for sure
have helped everyone to save time.
As for switching to another OS : I disagree with obliging people to
use another OS that the one they did so far. This already happened
years ago - did one forget this ? - with Micro$oft.
In my case, installing FreeMiNT or whatever other distrib wouldn't
be a real problem : I have a second 20 GB HD just for that purpose.
But, I have been used to store data, programs and system where *I*
want, and not let the OS do it's soup on his own.
With the MagiC installation that I'm currently running, the system
is on C:\, except some parts (the fonts and drivers, for instance)
that I placed on E:\, which contains data, while the programs are
located on D:\, some other parts being stored on other partitions.
This way, I'm almost sure corrupted data won't lead in the loss of
my whole data. Does MiNT allow this ? I read it used to mix every-

thing in one place... :-/
Sorry for being so long, but I thought the problem had to be analyzed
in a way that would help things to go on with no hurt.
I hope I did success. :-)

Regards,

J.-Luc

I don't have any issue with Mint. I have a completely functional Mint setup on my Falcon. But there are times when I would love to be able to hop into Magic and not have to reboot back to Mint to say surf the internet. It would be nice to be able to bounce back and forth and all the hardware and most software (except Mint specific and Magic specific) would just work. I am willing to learn and I think this maybe the perfect project to try and revive. Anyone willing to go in with me and help me learn or teach I am up for the challenge.

Offer is open ended.

it isn't necessary very *hard*... but you need a lot of experiences,
both in debugging and development area, especially in 68k asm and C
languages coding... so for sure task not for any novice...

i agree it would be nice to have it under magicnet but you know --
even when I (or someone else) find the source of problem (bad offset,
changed binary format, ...) there's no guarantee it will work
immediately. OK, ethernec is working but ... you know, you can be
never sure. so it may be completely waste of time.

I agree this could have been handled better with some official
statement. On the other hand, MagiCNet *was* supposed to be compatible
with MiNTNet. It's not always easy to forsee these things... The thing
is, they did release the source code for the driver, but as of yet no
MagiC programmer has picked it up.

> As for switching to another OS : I disagree with obliging people to
> use another OS that the one they did so far. This already happened
> years ago - did one forget this ? - with Micro$oft.

I think get your point, but I don't agree with the Microsoft analogy
at all. This scenario is completely different.
Developers are faced with one dead OS, and one that's being updated
and supported. Writing software for the latter means supporting
ongoing OS development, hence it's a natural choice. It's not about
forcing users to upgrade for commercial purposes.

Nah, it's not like that at all. MiNT is very flexible in this aspect.
You can have your data anywhere you like, and on filesystems which are
much more secure than FAT & Co. The only fixed path is the MINT-
directory, where you keep the kernel and device/filsystem drivers.

> Sorry for being so long, but I thought the problem had to be analyzed

FA: MIDIman Mini Macman MIDI Interface (Falcon & Mac)

Here's another item from my studio that I used with my now sold
Falcon. This little MIDI interface works with serail port equiped
Macs, but also with the Falcon using the LAN port, and a special
Cubase Audio Falcon MROS driver.

It's a cheap way to give your Falcon an extra 16 MIDI channels.

I'll supply the winner with the MROS driver too.

Here's the link:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=320246364034

Thank you.

Source record: 3519

For auction - an Atari Falcon in a PC style Tower case. Includes an integrated SCSI CD-R drive, 14M RAM and HD. This is a very tidy re-case with all the Falcon's rear connectors accessible at the rear via a custom panel, and the 2 x MIDI and 2 x JOYSTICK ports accessible via additional sockets. The ROM port is accessible internally.

I am very willing to learn most certainly. But if nothing comes of it
maybe I can help lend some support in other ways to try and at least
make a runnable version of MagicXNET. I can offer testing if no one
else wants to mess up there there setup. Certainly if it is not hard
I wonder why no one has looked at the code for MagicXNET and seen if
there was anything obvious. It would seem to me that nothing has
changed with MagicXNET for years and someone somewhere knows what has
been changed by MINT developers so the same logic could then be
applied to the MagicXNET driver then. I mean if it comes down to
money I would certainly be willing for someone to come up with a
working driver for MagicXNET so all people that are running Magic
could benefit from this. Any further discussions with any programmer
would be entertained. Get in contact with me in this group or via
private e-mail and lets talk.

Talk to you all later,

Carey

I'm under the impression that most MagiC users use another network stack
than MagiCnet.

Unfortunately. :-(
Would it happen to be no MagiC-understanding programmer over there ?
Or, rather, no MagxNet-understanding one ?
I'm sorry I have no knowledge in MagiC, MagxNet, MiNT or so. :-(
The only thing I can do, is testing.
>

> directory, where you keep the kernel and device/filsystem drivers.

Ahah!? That seems rather good - for me, at least - ; but what for the
remaining MagiC users that may not have the possibility to do so ?

BTW, if some programmer reads this - I did mention it already, but
it may have been unnoticed - : the MiNT EtherNec driver is seen by
the file-info utility as an executable (ie fastload, TT-Ram and Run
in TT-Ram flags can be (un)set), while the one for the EtherNat is
not.
Maybe it could help... ;-)

Yes I did.

I've found out what the matter was. You can't click on a file/folder
before you hit the Control key. With my Magic/Jinnee setup you can.

Also you can't use the radio buttons to change your action so it seems
silly to have them.

So as silly to keep it for oneself and not bugreport it... coz it's a
bug : forgot to read what radio button was selected. next update.

Though here, the move will not be a "rename" (if same partition and TOS
>= 1.4), but a copy and delete of the old files (even if same partition
and TOS >= 1.4).

# 3012. [Q] freeMiNT + XaAES release ?

Newsgroup: comp.sys.atari.st
Date: 2008-05-02 09:36:50 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <481ae0b2$0$874$ba4acef3@news.orange.fr>
Source record: 3530

Hi,

If I trust what's written in the freeMiNT mailing-list at

<http://tinyurl.com/59efu7>

by Frank Naumann, there is a very recent tagged version in the
freeMiNT & XaAES developments' CVS.

What I would like to know is about a binary release of kernel,
AES and tools. It use to be released binary at unofficial WEB

<http://xaaes.atari.org/>

but it's not. Not either on official sparemint atariforge
or <ftp://sparemint.org/pub/sparemint/mint/kernel>, strange.

Is there a public announce currently pending ? Is there a
binary package prepared for those who can't build the binaries
themselves ? Any good news about freeMiNT & XaAES release ?

We're looking forward to get binaries, not RPM please but in
an ATARI readable format, if you care for "old school" users.

Best regards,

Strange questions to ask on CSAT, particularly if you're reading the
MiNT mailing list.

[...]

> We're looking forward to get binaries, not RPM please but in
> an ATARI readable format, if you care for "old school" users.

RPM is as much an Atari readable format as anything else readable on an
Atari but anyway I fail to see how a new FreeMiNT kernel could be of
any use to "old school" users but that's just me.

I'm not. I'm time to time reading the mailing-list archive.
Sorry, but I can't look after everything going on everywhere.

>> We're looking forward to get binaries, not RPM please but in

RPM meaning Red Hat Package Manager is a Linux format i.e. not
readable by an "old school" ATARI user. When I get a RPM package
I must use `rpm2cpio` then unarchive it under GNU / Linux on
my Mandriva Vaio, and then transfer it to my ATARI machine.

Do you better understand my question ?

Thanks,

Regards,

What's wrong with RPM? IMHO, RPM is as much readable as anything else on a
MiNT based system.

Anyway if you really want a for you readble format get the RPM's and
extract it. Then you can make a gzip or whatever for you suitable format.

rpm2cpio foo_bar.rpm | cpio -ivd

-i extract the files
-v show name and size of every file in the rpm
-d create the needed dirs

Kind regards,
Martin

Hi Martin,

Thanks for your answer. My question is about freeMiNT & XaAES release.

`rpm2cpio` can't be done under Mac OS X with my configuration.

```
Last login: Fri May 2 09:10:01 on console
Welcome to Darwin!
[albatros:~] admin% which rpm2cpio
rpm2cpio: Command not found.
```

This is specific to Red Hat Linux like distributions.

No, it's specific to operating systems making use of the RPM packaging
tools as a convenient way of handling software installation.

rpm2cpio is available for freeMiNT/XaAES. And as we are talking about
freeMiNT I can't see the point.

> This is specific to Red Hat Linux like distributions.

RPM runs very happy on a MiNT based system too.

HTH,
Martin

Well, even if it is tagged, there has been no official release.
Hence there is no reason to upload anything anywhere in any format yet
from what I can tell.

# 3022. Re: [Q] freeMiNT + XaAES release ?

Newsgroup: comp.sys.atari.st
Date: 2008-05-02 17:24:27 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <481b4e4b$0$884$ba4acef3@news.orange.fr>
Source record: 3540

Hi Martin,

Martin Byttebier writes :
> What's wrong with RPM? IMHO, RPM is as much readable as anything else on a
> MiNT based system.

I'm working with a minimal ATARI disk image that doesn't include
a command shell. I really can't install RPM packages. If I could
install packages, that'd mean I would have installed a peculiar
freeMiNT distribution, what I haven't done ... It's a simple
"old school" ATARI installation, looking like what was installed
with my Falcon30 in 1993 when Multitos was provided with it.

The minimal installation disk image I'm working on is located at

<http://eureka.atari.org/xa-my-aes.zip>

The command line shell is not strictly required for an ATARI OS.

This is also the case of my Hades 60 that boots with freeMiNT 1.15.12
and N.AES 2.0, because I had so many troubles with recent kernels. RPM
packages are useless for me, and I won't change that. I already tried
to install recent kernels, but I was forced to reformat my hard disk
and reinstall from CDROM backup, from scratch, really painful indeed.

So, because I can't handle RPM with freeMiNT, I must do it with
`rpm2cpio` with a Linux Red Hat like distribution (Mandriva).

It would be very simple for peoples like me to release kernel,
AES and tools (not all the freeMiNT distribution) like it always
used to be done :

<ftp://sparemint.org/pub/sparemint/mint/kernel>

It's about four years there's no such a release I'm afraid.

Best regards,

Before my Hades broke down I was running the latest kernel (1.16.x) which
I compiled from cvs and latest XaAES also compiled from cvs without any
problem. On my Hades XaAES proved to be more stable then N_AES.
Although I had a working N_AES 2.0 system I prefered XaAES for daily use.
The only thing I didn't use was memory protection because some programs I
used on daily base, like Okami mail/newsreader, couldn't handle MP that
well.

There are some snapshots of my (dead) system on:
<URL:http://xaaes.atariforge.net/screenshots.php>

# 3024. [ANN] Litchi 1.1B (small update, bugfixes)

Newsgroup: comp.sys.atari.st
Date: 2008-05-03 11:45:20 UTC
From: Pierre TON-THAT <toto@msn.com>
Message-ID: <481c5050$0$21147$7a628cd7@news.club-internet.fr>
Source record: 3542

Bonjour

Download on my website or directly in the folder :
http://rajah.atari.org/files/ -> litchi11b_uk.zip (100 KB)

News for this FTP client (STinG or compatible):

- bugfixes:
- no more crash at launch under MiNT with Memory Protection (*).
- removed bad TOS version detection (LPEEK)

+ shell capability in the local files window. Just programs launches.
+ the none-executable fichiers can be opened if an AV_SERVER is present.
+ Control is detected after drag'n'drop, for files moves
+ Alternate + mouse click : several items selected if one was.
+ mouse selection if an item was not selected (adding files with shift
is allowed, but while the rubberbox is active)

(*) could not test with both MiNT Memory Protection AND MiNTNet. If
someone could do it and tell, thanks.

Voilï¿½

Rajah
http://rajah.atari.org

# 3025. [ANN] KK Commander 1.0C (fixes)

Newsgroup: comp.sys.atari.st
Date: 2008-05-03 11:54:38 UTC
From: Pierre TON-THAT <toto@msn.com>
Message-ID: <481c527e$0$21142$7a628cd7@news.club-internet.fr>
Source record: 3543

reBonjour

Download on my website, or directly in the folder:
http://rajah.atari.org/files/ -> kkcmd10c_uk.zip

Changes (thanks Olivier Landemarre & Mark Branson):

- removed unnecessary code
- if right-click on unselected file, select it. If a selection
alreadly exists, no effects.
- mouse selection with rubberbox (initiate it on an unselected file).
- Control key detected also at the end of drag'n'drop (for files moves)
- Alternate key detected with mouse click (select one file, then
select another + Alt key pressed)
- radio buttons correctly read in the confirmation dialogbox for
copying/moving files.

Voilï¿½

I will work this week-end on my gem games to work with MiNT Memory
Protection, without recompiling yourself.

# 3029. [ANN] my games and toys for MiNT Memory Protection

Newsgroup: comp.sys.atari.st
Date: 2008-05-04 01:32:42 UTC
From: Pierre TON-THAT <toto@msn.com>
Message-ID: <481d123a$0$21149$7a628cd7@news.club-internet.fr>
Source record: 3547

Bonsoir

Download directly in the folder http://rajah.atari.org/files/ but I
strongly advise you to get the files from the webpage (link at the end
of this post). All updated files are dated on the May 3th-4th 2008.

These releases are bugfixes for MiNT setup with Memory Protection mode:
no more crash at launch. If you'll never use MiNT, you need not to get them.

I had a lot to fix, verify, archive and upload, so please tell me if
there's something i forgot (ie some global malloc forgotten for bubbles
or stguide or other utilz).

List of games and toys fixed for MiNT MP:

- DGEM (and its level editor)
- Rosemary Racoon's Strip Game
- Manga Puzzle (1)
- Teenage Queen Reloaded
- Sygne
- MyJester
- Tramiel Quizz
- VDI_FX

(1) found a bug on the image conversion 256c -> TC32 (MagiCMacX), may
correct it or not...

Next step: same fixes for my applications and utilitaries... Please be
patient, there's really a lot to correct, test, zip, upload.

Voilï¿½

Hi,

Thanks for the answer. The one you gave is correct.

I updated the ATARI Search Engine <http://eureka.atari.org/atari.html>
erasing persistent invalid links. For the following link

>> <http://www.atariactive.com/>www.atari-forum.com

I modified it with <http://www.atari-forum.com/> because it is valid.
The other bookmarks seem to have disappeared from the WEB unfortunately.

I will test missing ones later ... Just in case.

Best regards,

That's what I discovered just after submitting the post. There's
no problem with this ATARI-Forum listed in my personal bookmarks

<http://eureka.atari.org/atari.html>

> Ever heard of Google ?

Of course yes ... If one looks at the ATARI Search Engine given above,
you'll see I'm using *Google Co-op* for my own *Custom Search Engine*
I created this ATARI Search Engine with the ~600 bookmarks listed there.

May I advise you to use it for your ATARI searches ? Just put its code
in one of WEB pages where you'd like to provide dedicated ATARI search ?

Best regards,

# 3035. Modified ST 520 RAM Board Question

Newsgroup: comp.sys.atari.st
Date: 2008-05-04 22:52:13 UTC
From: FMH <fmhcentral@gmail.com>
Message-ID: <481e3e0e$0$7686$4c368faf@roadrunner.com>
Source record: 3352

I dug out a ST 520 that I did not know I had the other week and saw that it was modified. The give away was a toggle switch on the left side of the system. I was thinking that it maybe had a TOS Selector in it so I opened it up and saw that it had a RAM Board, some kind of CPU plug in to the RAM board and wires running from each TOS chip to the toggle switch. I have no idea what the mods are except obviously the RAM Board. I can get the unit fired up and working with the toggle switch one way but pushed the other way I get a couple of BOMBS. I guess the switch is for Standard and Modified Modes. When it boots it comes up with 512K RAM and TOS 1.4 Rainbow TOS.

Here are some pictures of the system.
http://fmhcentral.freeservers.com/FMH_Central/Pics.html

Does anybody know besides the extra RAM what the CPU socket and wires to the TOS chips are for?

Thanks

I hate to admit it, but Le Coat may have a point.
Personally, I'm using a unix-ish setup, which means RPM:s are the
prefered way of doing things. It's great and easy to use. In a minimal
setup, i.e. without a "real" unix setup, I think a simple .ZIP would
be better. On the other hand, it's not like we release new kernels
every other day, which means this isn't really a big issue.

Personally I've had no issues with recent kernels, neither on my CT60
or my Hades. What kind of problems are we talking about?

That's a pity we can't find Julian F. Reschke. Spin 0.34 is a very
good CDROM driver I'm using on the Hades 60, very versatile.

We can find Spin in various ftp servers anyway.

Many thanks for your help.

>
Well, you didn't ask me, but anytime you deal with virtual memory the computer has to both send data from memory to hard drive and retrieve data from hard drive to memory. However, the Falcon can only manage about 2 MB/s in a perfect world, and real world numbers are often about a tenth of that. Since CD quality audio runs about 150 KB/s, a Falcon will be hard pressed to record it via Outside, although it might barely work. Video at nearly any decent resolution is out of the question.

On the other hand, if you intend to use Outside to convert file formats, you should succeed, although the overhead will make your translations some 2 - 3 times longer.

Galen

Hi François,

I hadn't thought of using an EeePC as an Atari. How practical is it?

Galen

Hi, I personally have installed Aranym on an EeePC (512Mb RAM, 4Go Hd)
under WinXP.
I work in a window 640x480xTC. Good reactions of the system.

But someone has installed Aranym under Linux and it looks like its
really more powerful (Tests made with Kronos from Olivier Landemarre).

So if you really need power with your atari applications, I recommend
using Linux.

I had to install WinXP because I wanted to re-use some windows
applications I have (most in mathmatics and programmation).

Have a look at the Kronos Page to view the results:

http://kronos.lutece.net/

Guillaume.

Reading the motherboard perfs result page (cleaned short version)

(a) PlayStation 3 Cell 3.2GHz ARAnyM 0.9.5 (no JIT) 259
(b) Dual-G4 1.25GHz ARAnyM 0.9.5 Mac OS X (no JIT) 304
(c) Hades 60 freeMiNT 1.15.12 + N.AES 2.0 670
(d) CT63 100MHz 16MHz bus 1194
(e) Coldfire Evaluation Board V4e 200MHz 1375
(f) EeePC Celeron 630MHz - WinXP - ARAnyM 0.9.6 JIT 1845
(g) EeePC 701 Celeron 630MHz Debian ARAnyM 0.9.6 JIT 2523
(h) EeePC Celeron 900MHz - WinXP - ARAnyM 0.9.6 JIT 2897
(i) MacBook Pro 2.4GHz ARAnyM 0.9.6 Mac OS X JIT 10735

Comments

(a) and (b) will there be a JIT for ARAnyM / PPC one day ?
(c) and (d) we are not speaking of the same display perfs !
(e) partially or fully ATARI compatible ?
(f) and (g) GNU / Linux is much better than WinXP ?
(h) no GNU / Linux comparison ? you must use EeePC at 900MHz !
(i) impressive and expensive ! the most powerful hardware / Linux

These result figures are cruels, but that's objective information.

ATARIstically yours =)

Perhaps yes, but you forget put an other interesting result
Athlon 2600+ Linux Aranym 0.9.5 (No JIT + MMU) 485
or better
MacBook 2.2 2.2GHz OSX Aranym 0.9.6 (No JIT) 734

that is far better than under Playstation or EeePC without JIT

> (c) and (d) we are not speaking of the same display perfs !

Yes this why there is 2 other tables for this look in web site.

> (e) partially or fully ATARI compatible ?

I not known any computer fully compatible with ATARI computer, Hades
was not, Milan too like Aranym when use fVDI
but kronos work without any change on it. And this is the faster
computer for the VDI! (I have to put results)

> (f) and (g) GNU / Linux is much better than WinXP ?

Linux looks really better than WinXP for run Aranym, this 2 systems
can't be compare. Notice probably one was compil (linux version) for
EeePC processor while WinXP Aranym version was generic version (for
386!) perhaps the problem is here for a part.

> (h) no GNU / Linux comparison ? you must use EeePC at 900MHz !

Why???? There is a test under EeePC at 630MHz with Linux and WinXP
thats enough

> (i) impressive and expensive ! the most powerful hardware / Linux

Yes

>
> These result figures are cruels, but that's objective information.

Not cruels, in fact I use today Aranym without JIT and with MMU (I
could use JIT but I have no really interest to go faster), this is not
very very fast but it's quite enough to run Atari applications in good
conditions, thanks to video speed under fVDI, and probably this is the
most important. In my opinion Playstation 3 or EeePC are enough for
run Aranym. Have fun.

Oups I have wrong here Tiny_gl.ldg and fpu.ldg was compil for V4e in
this case, V4e is not compatible with 68881 or even 68060 FPU
as for 68060 computer test we use the best lib for test.

OL

# 3046. MEGA ST info

Newsgroup: comp.sys.atari.st
Date: 2008-05-08 02:33:53 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <48226691$0$4068$bbae4d71@news.suddenlink.net>
Source record: 3364

I've ran into a weird problem with a Mega ST. Maybe someone who still
reads this group may have seen something similar or knows more about
the mega chips.

Upon boot up the internal drive will not read any disk (even a blank
format).
The desktop will come up on screen and I can change resolutions.
However if I attach a 2nd Disk Drive, the Mega ST seems to try to format the
drive(disk).

I can try to access the internal drive from the desktop, when doing so,
the drive sounds like there is no disk in the drive to read.

I though that the Drive chip may be bad, but I know that other chips in the
Mega also have something to do with Drive signals. I think the Sound
Chip and maybe the Video Shifter relate drive signals, but not sure
what part each control?

And does the keyboard have anything to do with the drives?

The Mega is a version 5.0xxx motherboard. with TOS 1.4.
Stock unit with 4megs. Used very little.

.

# 3047. Atari 1024ST-FM questions...

Newsgroup: comp.sys.atari.st
Date: 2008-05-08 02:35:17 UTC
From: Mitchell Spector <mitch2gs@hotmail.com>
Message-ID: <tdo424l058b9j1ctucgu4d9voqfq87832a@4ax.com>
Source record: 3365

Found and bought an Atari ST (1024 FM) tonight for $3!
Figured I should grab it up, years ago I bought a 520 FM
and never was able to do much with it, considering its
lack of memory and single-sided floppy drive.

This one is in good cosmetic shape, apart from the
'Backspace' key steam broken (nothing some crazy
glue won't fix) and coming with a generic PC serial
mouse with an AM/AT switch on bottom. Still, I'm now
wondering if it's dead or alive...

Plugged into the RF connector to my TV set but all I
get is a black screen. If I tap on the keyboard, I get a
"beep" feedback sound through the TV's speakers if
that means anything. I can hear the floppy drive trying
to seek, looking for a disk for about a minute, but when
it gives up, GEM does *not* load up. Shouldn't be in ROM?
The power LED for the floppy stays lit up orange, it never
goes out. Shouldn't I see some image on screen?

I tried an old Windows-based program called WDFCopy
v0.09 to create a bootable disk, but after inserting it in the
ST, it just gives up after a few brief seconds (not certain it
created a proper disk though, it's been years since I last
tried tinkering with an Atari ST).

Anyhow, I used the Apple IIGS back in the 80's, and
tinkered with the Amiga on and off in the 90's but never
had a chance to play with the Atari ST. Any chance of
getting this one working, or am I out of luck, again? :)

Mitchell Spector

Its not serial, its an Amiga/Atari mouse.
>

It is.

> The power LED for the floppy stays lit up orange, it never

This can occur if there is no disk in the drive and the desktop hasn't
booted.

Shouldn't I see some image on screen?

Yup, a green desktop.

Just use a blank formatted DD disk. The Atari ST doesn't need a boot disk.

I would build/buy a video cable to suit composite output. It is better than mucking around trying to tune the TV to as a monitor.

Something like this;

http://tinyurl.com/5fftyf

To make a composite cable you just use pins 1, 2 and 13. I will draw a schematic for you when I get a minute. Bugger it, here you go;

http://members.optusnet.com.au/~startreks/stcct.html

Good.

You may use an ATARI spreadsheet for charts like Texel, GemGraph,
3D-Calc, LDW Power, VIP, ATARI Works etc.

>> (a) PlayStation 3 Cell 3.2GHz ARAnyM 0.9.5 (no JIT) 259

Of course yes. But the principle of a benchmark is not to compare
perfs of systems in the worst case. One tries to take the best we
can obtain from a computing configuration. Otherwise you don't mix
results, and you speak about "best case", "worst case" or even in
the "mean case" etc. You should compare what can be compared.

>> (c) and (d) we are not speaking of the same display perfs !
>
> Yes this why there is 2 other tables for this look in web site.

With ET4000 1Mb V-RAM graphic card Hades60 displays 800x608 64k colors.

>> (e) partially or fully ATARI compatible ?
>

> I not known any computer fully compatible with ATARI computer, Hades

Figures are there. We speak about what is published, not as it might be.

>> (h) no GNU / Linux comparison ? you must use EeePC at 900MHz !
>
> Why???? There is a test under EeePC at 630MHz with Linux and WinXP
> thats enough

We can't compare with EeePC at 900MHz / Linux. Maybe GNU / Linux
can't control the frequency of the CPU at 900MHz, eventually ?

>> (i) impressive and expensive ! the most powerful hardware / Linux
>
> Yes

We speak about an Intel Mac (Mac Book Pro) with a dual-boot x86-Linux
Ubuntu & Mac OS X Leopard, don't we ?

Well, as you can see PlayStation 3 and Power Mac G4 are at the tail
of the performance list. I wouldn't mind if it was a little quicker ;-)

I do agree, it's great pleasure and gives great satisfaction indeed.

ATARIstically yours =)

Hey Barry! I know you've got a lot of other ST stuff lying around - how
about switching out the floppy drive with a known working one? At least
that way, you could rule out the drive, before you started chip-chasing.

The Mega models aren't too hard to take apart.

Hope this helps.

# 3053. Re: [ANN] my other app for MiNT Memory Protection

Newsgroup: comp.sys.atari.st
Date: 2008-05-08 21:46:09 UTC
From: Pierre TON-THAT <toto@msn.com>
Message-ID: <482374a1$0$21142$7a628cd7@news.club-internet.fr>
Source record: 3371

Bonsoir

Fixed the crash at launch under MiNT environment with Memory Protection,
also for the following applications and utilitaries:

Cri¿½sus
Troll (*)
Joe et ses modules
Iphigi¿½nie
Meg (*)
my utilz for fVDI (Configurator, Commander, Snap, RageCalm)

(*) like the Litchi, cannot test with both MiNT Memory Protection AND
MiNTNet+gluestik.

Conclusion: near all of my programs and games have been fixed. Please
refer to the date release wich begins at May 2008. If you encounter
problems while running the programs, under MiNT + Memory Protection,
please report to me.

Some programs (Blaise, Xport2 and GFAMenu) were not fixed. Considered as
dead.

Voili¿½

Pierre

Already, switched out the internal drive, with a known working mech. And
got the same results.
Also tried an original Atari external disk drive and a GoldenImage which all
work fine on
my 1040STe. I replaced the powersupply and it's purring like a panther. I
mean kitten.

I've had the Mega apart, as I was going to do a few upgrades before this problem came up.

Reason I ask about the keyboard, is I plugged in a TT keyboard before this problem came up.
Unless all TT keyboards are the same, the one I used seems to be a non-US version.
Due to what appears to be a Sign for the UK Pound on one of the number Keys.

I then tried a original Mega keyboard but get the same. I think it's a chip problem.
Btw the mega acts, you'd think it has its NVRAM messed up. But the mega doesn't
have NVRAM.

If a bad keyboard can mess up the drives then it's possible that I have 2 bad keyboards, I have another
Mega keyboard that I'm getting ready to try just to make sure. Then going after the Yamaha chip.
Most of the chips in this mega are socketed, maybe ones loose.

.

Ahh, that's what the AM/AT stands for (AMiga/ATari).
At the very least it looked like a modified PC serial mouse,
underneath the switch I can see "MS" and "PC" embedded
in the plastic. Interesting, I have a similar Amiga mouse with
the same switch and never realized it was Atari compatible.

And if memory serves right, it should just come up on its
own after several seconds if there is no boot device found.
There's no special key press to boot GEM from firmware, right?

If I don't have one available, will it still boot into GEM?
(seems to me my 520 ST-FM did if I left it on long enough)

Thanks, that should be helpful, but that's assuming the
RF modulator is faulty (I've seen that before on other
computers, but usually you don't get picture OR sound--in
this case I can hear the "beeps" pressing keys which
tells me it is tuned in correctly).

>To make a composite cable you just use pins 1, 2 and 13. I will draw a
>schematic for you when I get a minute. Bugger it, here you go;
>
>http://members.optusnet.com.au/~startreks/stcct.html

Is pin #2 composite-video and pin #13 ground?
I have RGB monitors that work at NTSC/15.75 kHz
and could wire a cable, but I'm not likely to find that
non-standard DIN-13 connector.

Incidentally, I opened up the Atari ST today to have
a look inside. The motherboard is labeled "C070789-001
Revision D/Action D2". Most of the chips are soldered
in, but I tried pressing down on the socketed ones. Also
unplugged the keyboard and floppy--still just a black
screen and the "beep" (or "click") when I reconnect
the keyboard and tap keys. Actually it continuously beeps
if you have the keyboard disconnected.

Either the RF modulator is faulty or something else is
blown. Kind of reminds me of my C64's that won't boot
up and just show a black screen (in those cases, I think
they have bad RAM). Ah well, if I had a bootable Atari
disk I could at least see if it's a video problem or not.
I may just give it away or toss it eventually...

Yes it should, but it can take a while. Initially you should get a white
screen.

It'd be pretty rare on an Atari.

The constant click is normal. There is a fix iirc using a single
resistor. I used to do that when I was fixing ST's, wasn't so annoying;-)

>
> Either the RF modulator is faulty or something else is
> blown.

Possibly the video shifter? Tho I'll ask the obvious and ask if you have
tried tuning it?

Kind of reminds me of my C64's that won't boot
> up and just show a black screen (in those cases, I think
> they have bad RAM). Ah well, if I had a bootable Atari

> I may just give it away or toss it eventually...

All disks are bootable as far as the Atari is concerned. just drop a
blank one in. Another problem is that the composite video is derived
from the RF modulator, so if it is faulty then composite won't work either.

?????
Why? for example Athlon 2600+ Linux Aranym 0.9.5 (No JIT + MMU) 485
is comparable with Playstation 3 values, in this 2 case there is no
JIT, that is the only differences of this 2 computers.

>
> >> (c) and (d) we are not speaking of the same display perfs !
>
> > Yes this why there is 2 other tables for this look in web site.
>
> With ET4000 1Mb V-RAM graphic card Hades60 displays 800x608 64k colors.

And??? Notice the only difference with 32 bit and 16 bit for the
second table is only the transform from 24 bit to this display and in
fact transform from 24 to 16 bits is a little bit faster than
transform 24 to 32 bits.

>

Like Playstation nor PC nor Mac Computer is not!
Now big diffrence beetween a specific hardware computer is it is very
easy to have native software under it that is not easy at all under
Aranym. I wan't compile for V4e Tiny_gl.ldg I just change compil
target and thats all as I do for 68060 in past, it run, I'm able to do
this under Aranym but I should add code in Aranym itself and create a
new ldg that call native one and have a translation of address in
Atari world and host world, near 3 weeks of work to do this and
probably Aranym team will not agree to add all sort of source code in
there software!

>
> > but kronos work without any change on it. And this is the faster
> > computer for the VDI! (I have to put results)
>
> What kind of display system for the Coldfire Evaluation Board ?

This is an Radeon 7000 (128bit bus) on PCI with a lot of native
primitive call, so it's really fast, this sort of graphic card could
be put on your hades, result will be better than on the coldfire card
I think because fVDI kernel was not compil natively and memory access
on this evaluation board is slow in fact, this is not a real computer
but interesting for us.

>

>
> Figures are there. We speak about what is published, not as it might be.

Oh no, you alway's transform results, even if it was not better on
Linux than for this case(I don't think so but I'm going to ask to
David to have this result for you), can you explain me why most user
will not use Aranym JIT when they can?!!!!! And result is quite
different:
EeePC Celeron 630MHz - WinXP - Aranym 0.9.6 (JIT) 1845
or
EeePC 701 Celeron 630MHz - Linux Debian - Aranym 0.9.6 (JIT) 2523
or
EeePC Celeron 900MHz - WinXP - Aranym 0.9.6 (JIT) 2897

Good reason? Compatibility is very good even with JIT (never be able
to find a software running without JIT that not run under JIT this is
possible probably but wich one?), speed is far better. I know only one
reason not use JIT, it's for developper's only that wan't fix bugs
using memory protection (like using NULL address under JIT not crash).
Do you use your Aranym with MMU and full system memory protection? Me
yes, but you not. For user there is no reason and if speed for you is
the most important, so EeePC is better than Playstation 3 but I think
we don't buy playstation or EeePC for Aranym only!

>
> >> (h) no GNU / Linux comparison ? you must use EeePC at 900MHz !

> > run Aranym. Have fun.

>
> Well, as you can see PlayStation 3 and Power Mac G4 are at the tail
> of the performance list. I wouldn't mind if it was a little quicker ;-)

No
EeePC Celeron 630MHz - WinXP - Aranym 0.9.6 (JIT) 1845
or
EeePC 701 Celeron 630MHz - Linux Debian - Aranym 0.9.6 (JIT) 2523
or
EeePC Celeron 900MHz - WinXP - Aranym 0.9.6 (JIT) 2897
That is the true, and we wait for JIT PPC in Aranym that possible
change this reality, and I will be very happy to add this results on
my web page, if you have this send me!

Now I am going to be a bit malicious, have you try to report results
to processor frequency?

At the same speed frequency EeePC under WinXP, Aranym for 386! should
have a value of 477 And Playstation 3 have only 259. And I wait for
results with Linux compil for EeePC!
>
> I do agree, it's great pleasure and gives great satisfaction indeed.

Yes and that is most important, and EeePC user have the same
satisfaction, strange isn't it!

And now look at this:
http://leeenux.blogspot.com/2008/02/eeepc-et-mac-os-x.html

Good video! I don't know if you can do this on Playstation 3 and if
your Apple computer can boot as fast as this. For an obsolete computer
this not so bad!

# 3060. New: High Density floppy adapter with automatic steprate fix for ST machines

Newsgroup: comp.sys.atari.st
Date: 2008-05-09 17:10:06 UTC
From: pp <ppera@ppest.org>
Message-ID: <8a429f5d-00c5-4ffe-9d70-5dffc701727d@b1g2000hsg.googlegroups.com>
Source record: 3378

Floppies are now little obsolete, maybe even by oldies. Anyway, I
designed, built and tested today something new (at least I didn't see
such solution anywhere): HD floppy adapter with hardware steprate fix.
For Atari ST machines.
So, no need for any steprate setting program or patch. It works with
all TOS versions well.
Of course, DD floppies work as without this adapter.

I plan to produce little add-on board, which can be placed on top of
FDC chip. Of course, if there is still people interested for something
like this...

>
> Good luck.
>
I went back over the Mega ST PCB, and it has a problem with a chip or chips
that control
the reading/writing of a disk in the drive. I disconnected the power to the
internal drive and rebooted.
The Desktop comes up instantly without any drive Icons. I went a step futher
and added an
external disk drive (known to work) while leaving the power off the internal
drive.
And rebooted. Again as with the internal drive connected, it takes 1-2
minutes for the desktop
to come up. I can select items from the desktop, switch resolutions, add
devices and etc.
But if I try to read a directory from drive B, then I get the ole error
message that the disk maybe
damaged. I get the same results from the stock internal disk drive.

So, I'm positive that the internal drive is good. Just a matter of finding
and replacing the correct
damaged chip. I think I have what I need here to track it down, just thought
I'd ask in here to see
if anyone knows for sure which chip in the mega controls the reading/writing
of a disk in the internal/
external drives?

Guess I'll have to dive into a few of my tech manuals for that.

I'd like to fix this Mega as it's a nice one, used very little and has the stock 4megs.
If someone reading this happens to have a Mega ST that they no longer want then I'd be
interested in it for parts. I don't have to have the keyboard or the case or the internal drive for that
matter, a working motherboard will do fine, version 5.0 if possible.

Send me a e-mail with details on the Mega ST that you have to get rid of or sale to me
at: phantomm@bellsouth.net

Hello,

I have added the HD controler and a Vortex ATonce into my Mega STE.
Since that, I can't get my NOVA graphic card to work!

I have tested the ET4000 board into a PC, it works fine.
Is there something I have "moved", a jumper or else that can influence the
VME?

I have made the tests again without the Vortex, nothing changes, the NOVA
still is down.

Has someone experienced a conflict between those pieces of hardware?

Help!

Guillaume.

Hello,

You could have some loose chips and possibly the memory chips. I would take off the cover and just press down on all of the chips and then try it again. I had one do the same thing and this worked for me.

Source record: 3381

Hi Guillaume,

I have a Vortex ATonce in my Mega STE, the 386SX version with the optional Fast Ram. I'd like to find/get the 80387SX Co-Processor for it. Anyone have one?

I also have a NOVA Graphics Card (MSTE/TT) version, but have not installed it into my MegaSTE yet.

Thought that the NOVA was a different board from the ET4000?

I have a ET4000 board. But my NOVA is in a box case and without looking I think it is a MACH board. Maybe both are one in the same?

Will take a look and let ya know what board is attached to my Nova VME MSTE adapter.

My MSTE is a factory 4meg, TOS 2.06, with internal hard drive. Also has the High Density
internal disk drive.
I've had no problems with it and the ATonce 386SX.

I was going to install the NOVA, but want to put a Ethernet VME board in it. I'll try to order one, unless someone reading this has a working one for sale/trade.

My MegaST went bad which has put me off from upgrading the MSTE.
Currently, I am going through all my Ataris, and upgrading, modifying and cleaning
them.

As for your problem, Check all cables from your Graphics board to the VME for
damage or loose connection.
I don't recall if the Nova has a driver that must be installed without checking my
manual. If so, I'd re-install it and boot up with only the necessary AUTO and ACC
programs in case you have a software conflict.

Have you used NVDI in the past with your ET4000?

Also, what version is the ATonce, is it a 286 or 386?
Do you have the manual and software for it, if so what version is
the software you are using?

I'll check my manual and software version and get back to you.

You said, something about installing a HD Controller?
Did your MSTE not have one already, or do you mean something like
a Link 97?

phantomm@bellsouth.net

It's a ET4000 ISA board.

> As for your problem, Check all cables from your Graphics board to the VME
> for

I have changes the two ribbons, not that..

I reinstalled the software, not that either..

> Have you used NVDI in the past with your ET4000?

Non, never.

> Also, what version is the ATonce, is it a 286 or 386?

The 386, I have the software, but not the manual.
I you have it, it could help!

> You said, something about installing a HD Controller?
> Did your MSTE not have one already, or do you mean something like
> a Link 97?

There was no internal HD support (a Mega STE Open).

Since yesterday, more problems came: now it can't see any of my ACSI
units! Booh... Is it dying?

Guillaume.

Actually there are different boards, According to my Nova Manual.
Each has different amounts of memory and color/resolution capability.

>
> The 386, I have the software, but not the manual.
> I you have it, it could help!

Yes, I have the manual for the ATonce and the Nova
with the original software disks.

The manual would help with using the ATonce, but from what
you have written, it sounds like there is something else wrong.
When I get the time, I'll look thru my manual and see if I find
anything that can help.

>

I still do not fully understand what you mean here.
The Mega STE did not have the internal hard drive option and you
added a internal hard drive controller?
Or did you add a external hard drive controller, such as a ICD Link,
Link 97, or etc?

Since your problems started when you added the HD Controller and Vortex,
I would think that it has something to do with the HD Controller.

If I knew which one you added, it would help me understand your problem.
The MSTE internal hard drive controller can be alittle unstable if not
connected
firm and with good ribbon cables.
Also, the MSTE does have switches that effect the internal hard drive
controller
board if I remember correctly, there is a DIP that has to be in the right
selection
to tell the Computer that the internal controller is connected.

I don't know if your MSTE came from the factory without the internal hard
drive
connector or not? Some were made without it.
If you's did not come with one, and you added one, then you may need to set
a
selector switch.
I have the info here somewhere, will look it up asap.
But need to know what type of HD controller you connected and are trying to
use?
A internal unit connected to the motherboard?
Or one connected to the Hard Drive Port on the back of the Mega STE?

>
> Since yesterday, more problems came: now it can't see any of my ACSI
> units! Booh... Is it dying?

Not good, I'll look up what info I have and see if I can find something to
help.

That's it!

> Since your problems started when you added the HD Controller and Vortex,
> I would think that it has something to do with the HD Controller.

I tried without the HD, without the Vortex, and now it looks like
something is broken... The NOVA don't seem to work.

> Also, the MSTE does have switches that effect the internal hard drive
> controller
> board if I remember correctly, there is a DIP that has to be in the right
> selection
> to tell the Computer that the internal controller is connected.

What is strange is that:
- before any change, the NOVA was Ok, then (with the same disk running
the same programs) it didn't work
- the internal HD used to work, but then no ACSI/SCSI disk were
detected.

It seems to "die" piece by piece.

> If you's did not come with one, and you added one, then you may need to
> set a
> selector switch.

I'd like to know wich one to save something in this machine... I have
searched the internet but can't find the technical documentation for a Mega
STE.

> I have the info here somewhere, will look it up asap.
> But need to know what type of HD controller you connected and are trying
> to use?
> A internal unit connected to the motherboard?

This one yes, internal unit from Atari.

Thanks for your help,

Guillaume.

Nope! I did notice a small metal cage with a liftable top cover. Is there
a potentiometer under here that might help? So I just twist it a bit and see
if a picture appears, or is there more to it than that?

>All disks are bootable as far as the Atari is concerned. just drop a

Well RF video would be passable enough to get started with, at least
to test things out. I tried pressing down on the socketed chips like
someone here mentioned (only two or three in this case) but that didn't
seem to do anything. Could the video shifter be the problem, or is bad
RAM more likely?

Easier than that, I mean tuning the TV;-)

Bad RAM in my experience is not that likely. I've only ever had one
Atari with bad ram and that was a 130XE. Shifter would be my first
thought if the audio was working. Then again there is plenty between the
shifter and the modulator than could be at issue. The vast majority of
faults I see with ele\ctrical gear is capacitors. But I'd try tuning the
TV and/or an AV lead first. It'd be better to eliminate the obvious.

Hello

I have problem to update my Eiffel interface, I downloaded last version 1.10 Eiffel control panel. During the boot of my falcon with CT63 I have information on the screen
Eiffel 1.0.9 10/2004 and in the next line:
Press fire during power-on for old firmware.
What does it mean.

From this archive eiffel.lzh I loaded eiffel.hex and press program flash, when finished i closed this control panel and reboot my falcon, but no change during the run of falcon I see the same information like previously.

The second problem is in the joystick I observed that in few games (for example Goods) the fire is not active.

Does anybody know, what is a problem.

best regards
Piotr Mietniowski

# 3078. 19" Rack Atari for Music rcording

Newsgroup: comp.sys.atari.st
Date: 2008-05-12 14:45:03 UTC
From: Sebastian Pohl <sebastianp@uni-koblenz.de>

Hello Newsgroup,

i just got a bunch of pictures of an interesting 19" Atari modification.
The unit housing the atari itself is 3 units high, the one with the
screen is 6 units high. It was used for music recording, a cubase dongle
is still plugged in. Does anyone know what this thing realy is and what
it is worth and where i can find someone that realy will appreciate this
thingie? :)

Thanks!

Regards

sebastian

Hey Greg! I've still got these listed on a random logoff screen on my BBS.

ape.penguinpowered.com

bbs.coldwinterknights.net

ainside.no-ip.org

stguild-bbs.dyndns.org

Hmm, after trying I couldn't get any of these to work. Has anyone else
tried lately? Thanks.

Surely, I'm not the last Atari ST based BBS out there? :)

nice one but beware, this version isn't 100% bug-free. that's the
reason why I use ripped .ttp ice packer (by MugUK I believe?). I'm not
sure what kind of bug it is but I think it was in some readme file :)

OK, now I understand what you are using, I am checking on a few things,
as this is abit weird for it to all start going bad on you.

I think I may know what it is, but don't want to say until I'm sure.
I'm checking out a few things on my MSTE.
BTW, what type of monitor were you using with the NOVA before
you added the Vortex? If VGA was it a multi-sync?
And did you get the Vortex to run and display on the screen before things
went bad?

How do I do that? All I can do is set the TV to channel 3 or 4 (and of course the 3/4 switch on the Atari itself).There's an auto-tuner built in to my TV set, no fine tuning dial like on sets you'd have in the 1970's. I'm using a coaxial cable with coax-to-RCA adapter to give the least RF video noise. Also tried an old fashioned RF switcher box from my Atari 2600...no difference.

Quick question: what is the video shifter and where can I find it? :)

A simple SVGA; no multisynchro

> And did you get the Vortex to run and display on the screen before things
> went bad?

Yes but for the Vortex test, I didn't use the NOVA, it was plugged in
the VME port, but I put a standard SM124 monochrom monitor in the video
output.

Does the TT/MSTE Nova have a separate 12V lead like the Falcon-version
does? If so, it's possible that you've disturbed the 12V feed to the Nova
when you installed the ATonce.

Hi Sebastian Pohl,

> i just got a bunch of pictures of an interesting 19" Atari modification.
> ... Does anyone know what this thing realy is ...

As i read 19" Atari i remember a project from a german electronic magazin
ELRAD (from 1992) which rebuild a Mega ST to a 19" version.

> http://www.twisted-artwork.de/pics/atari1.JPG
> http://www.twisted-artwork.de/pics/atari2.JPG
> http://www.twisted-artwork.de/pics/atari3.JPG

Your pictures show a atari with housing. Because the ELRAD project did only
show the 3 cards, i did not see, if your project was based on the ELRAD
project.

Best regards
Michael Bernstein

FamilyNet International Newsgate

Ok, Penguin powered is the Atarimax BBS, which has NEVER worked for me since 1999. Cold Winterknights was a great BBS, gone for about two years. Ainside is Marius's 8-bit BBS, gone about a year, and the ST Guild seems to come and go.

I was thinking the Grove BBS was back up, but misplaced the tlenet address for that. Trying to update the BBS list on the Prison Board. :D

# 3094. EtherNat & USB drives

Newsgroup: comp.sys.atari.st
Date: 2008-05-15 12:57:28 UTC
From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <482c3337$0$896$ba4acef3@news.orange.fr>
Source record: 3462

Hello,

As suggested in the subject : is there any way to have an usb
flashdisk working on the EtherNat ?

Regards,

J.-Luc

Sorry J.-Luc, I can't help you out...but I do agree that we atarians are in dire need of usb drivers, else what's the point of the usb ports on the ethernat? If someone could come up the drivers for usb mice, flash drives, printers, cameras, etc, it would make the ethernat that much more desireable. Too bad the usb drivers from Linux can't be used afaik.

First one has to be a lucky boy to own an Ethernat. I do not,
unfortunately.

I hope that the USB driver situation will be a bit more planned and
organised compared to the TCP/IP-stack-world ... worlds.

So, once again, we've been fooled! :-(
We bought a device that reveals totally unuseable for non-MiNT users
and partly useable only for MiNT ones... :-(
I think I'll never trust anymore anyone else than Rodolphe for any-
thing to be added to the Falcon. At least, he ensured his products
would work fine on every common OS people run.

In my opinion, any device that relies on using another OS such as Mint,
will not advance the Atari platform. This only makes the number of users
of advance hardware smaller.

```
I think anyone who wants to develop hardware and or software, should develop
for the whole or most of the platform. So that new users can pick it up
easy.
Most people simply don't have or don't want to take the time to install
another
OS so that they can run a piece of hardware.
```

We needed USB support for along time now as well as other things to keep
the platform going.
If possible, stick with developing items that will work with TOS and the
whole
platform will benefit.

Greetings everyone!

Here is the lucky and proud winner of the May 2008 prize
at The DarkForce! BBS:

May 2008
1. ST Magazine - Twilitezoner wins the free 3 mag. subscription

Congratulations to our winner!

---

Also, here is June's prize:

June 2008
1. ST Magazine - some lucky Atari caller will win a free 3 magazine
subscription.

Congratulations to our winner, and good luck to this months callers!

:)

```
I have found some time to look at the Vortex and Nova.
Here is some info on the Vortex 386SX that may help.

To start the Vortex 386SX with the default values you have to start the
program ATONCE.PRG from GEM. You should see a boot-message,
that gives you some info about the system configuration and you'll be asked
to insert a DOS system Disk.
You will get the usual DOS promp "A>" and you then know that it's working.

The Default settings are as follows...
One 3.5 DOS floppy drive (=internal floppy drive with then name "A".
No Hard disk.
VGA-monochrome-graphics video-emulation.
640KB DOS-Base memory.
Extended memory is 0KB.
Expanded memory is 0KB.
Atari-Mouse as Serial-Microsoft-Mouse (together with a Microsoft-
compatible driver, e.g. MOUSE.SYS, version 6.10) on COM 1.
Serial interface on COM 2.
Parallel interface on LPT1.
------------------------------------------------------------------------
Returning to GEM
Press the key "G" during the boot process to return to GEM Desktop.
```

If DOS is already loaded you can leave the AT-emulation with GEMDOS.EXE and return to the GEM DeskTop.
If DOS is already loaded press the "Left Shift","Alternate", and "Undo" keys together,
and you will return to the GEM Desktop.
---
Reset the system with the (Control, Alternate, and Delete) keys at the same time.

Skip the memory test of the 386SX by pressing the ESC key.
---
The INSTALL.PRG is started from the GEM Desktop. It allows the setting of all
operating parameters. To use the existing components of the (ATARI) computer system, it has to be configured, this is done using the (install.prg on the Vortex
system disk).

The settings are saved and stored in the (ATONCE.CFG)
There are quite a few options to select.
*Setting up the hard drive correctly is one of the most important!
(Too many details to go into here.)

*However you should be able to run the basic system using just a Floppy Disk.
There are 3 different boot- settings, (Floppy Boot, Floppy/Hard disk Boot, and Hard disk Boot).

There are several types of Floppy Disks supported...
---
1.44MB-2 sides-80-tracks- 3.5-format.
720KB-2 sides-80-tracks- 3.5/5.25 format.
360KB-2 sides-40-tracks- 3.5/5.25 format.
360KB-1 sides-80-tracks- 3.5/5.25 format.
---
With the program (INSTALL.PRG) you can determine the assignment of the Atari Floppy Drives A and B to the DOS-floppy drives A and B.

According to the manual Windows 3.0 will run in Enhanced Mode.
If you ever try to run Windows, Never Invert the EGA-Screen with the SHIFT+UNDO as it will cause Data Loss.

* When you are setting the configuration of your ATonce 386SX emulator with the INSTALL.PRG, you must not install Expanded Memory (set it to 0KB !).
Assign all free memory or your (ATARI) to EXTENDED Memory!
Also the EMM.SYS driver you will find on your ATonce 386SX SystemDisk is NOT needed! (IT's is there only for compatibility reasons to other vortex emulator-products).
(I'm not sure which products, but that's what the manual states).

All settings that have been done with the INSTALL.PRG will be stored in the emulator-

file ATONCE.PRG as well as in the configuration-file ATONCE.CFG.
If Install.prg is used another time and if changes have been made,
Install.prg automatically
generates a new ATONCE.CFG file. The old one will be renamed in ATONCE.OLD.

According to the manual DOS versions larger or equal 3.2 should be used
mainly because
of the support of 80 track floppy disks. If DOS 4.1 is to be used the 80286
varaition is
available.
Also according to the manual MSDOS 5.0 can be used with the Vortex 386SX.
But I am sure one could probably use DOS 6.XX or better.
On my FalconSpeed 286 board, I ran Win 3.1/DOS 6.22 with no problems.

FalconSpeed is alot like the Vortex 386SX, except there seems to be some
difference
in the way Hard disks and partitions are used.

I also have 2 SuperCharges, I haven't used for along time, It ran off a hard
drive and I still
have the system, just not connected up.

I like what you did with your SuperCharger, I found a CO-Processor in an old
286-12mhz NEC that I put in my SuperCharger a few months back.
The 286 is also socketed, and could be used for projects.
---

The MEGA STE
---
I looked for info on the dip settings, I have some info on it here
somewhere.
But for now all I could find is a diagram of the settings which to my
knowledge
is how they are suppose to be set with an internal hard drive.

The Blue 8 selector switch settings located on the right front foward
corner,
All Switches are down toward the front of the Mega STE except for (7)
which is up toward the back.
---
The NOVA Graphics Card
I don't know if you have the manual or not.
But it stresses the importance of installing the card correctly
or damage to the card and system can occur.
Pretty much the same as with the Vortex 386SX.

Here is the order of the drivers and according to the manual
they must run before anything else.
EMULATOR.PRG
MENU.PRG
STA_VDI.PRG
STA_VDI.BIB and EMULATOR.BIB need no

particular order.
An auto folder organizer such as XBOOT, MouseBoot is very useful.

A two monitor system is very useful since you can observe the process of
booting up and the possible errors.
On a MSTE, you can have your SM124 monitor still plugged into
your monitor port.

When starting the NOVA Graphics Card, Hold down the two Shift
buttons while booting up and you'll get the NOVA MENU.
When at this Menu, its very important to set SubMenu "a" and "b".

I hope this info helps in some way.
I will check on a few other things, asap.

BTW, Mplayer is really helpful.

Yeah, that copying mint.prg into auto folder and mint directory to c:
is really time expensive operation...

I understand your concern, it would be definitely better to have
drivers for both sting and mintnet but remember, there are only
limited resources (in manner of atari programmers). It's not HW
developers' fault MagiCNet is dead and author disappeared. So if you
want to use your Ethernat, I recommend you either do that "time
expensive" copy operation or code driver by yourself.

USB stack is another story but honestly -- in case they decide to
develop something as huge as this, would you be willing to accept the
waiting for the Ethernat another 3-4 years? Me definitely not.

Ahah? Just doing this would allow MagiC! users to use MiNT-Net
drivers ?
I wonder why such an important news hasn't been unveiled so far...

I'm not sure if I understand you correctly but yes, copying one prg
and one directory is enough for installing whole FreeMiNT (if you
aren't interested in unix stuff) and Ethernat drivers.

> I wonder why such an important news hasn't been unveiled so far...
>
What about reading README in FreeMiNT release? There's such clear (and
exhaustive for each situation) explanation I can't imagine what else
you could be looking for.

http://sparemint.org/sparemint/mint/kernel/1.16.1/readme.txt

# 3106. MiNT-Net stack (ex: EtherNat & USB drives)

!?!?!?!?!?

I'm sure 99.9% users believe (just like me) that using MiNT-Net
requires whole MiNT stuff installation - not only a prg in auto
folder and some drivers to and fro -. :-/
Now, you mean that any MagiC! user could benefit MiNT-Net facilities
just at a glance ?
Once again, I always thought that installing MiNT-Net and other
related stuff, one would need some "make" commands that can only
be brought by MiNT itself, MiNT-Net beeing closely MiNT-dependant
in my mind - and more than surely in most non-MiNT users' one -.
>
>> I wonder why such an important news hasn't been unveiled so far...
>>
> What about reading README in FreeMiNT release? There's such clear (and
> exhaustive for each situation) explanation I can't imagine what else

>
> http://sparemint.org/sparemint/mint/kernel/1.16.1/readme.txt

Er... unless I didn't understand anything at all, it doesn't seem
possible to boot MagiC! and let it launch the kernel by putting it
in the START folder (just the way we do for MagxNet).
On the other hand, if my understanding isn't that much bad, I could
benefit multitasking and lfn just copying some files, and so wouldn't
need MagiC! anymore, that's right ?
By the way, I think the CT60 doesn't need the prg in auto folder...
Well, if it doesn't affect my config - ie, if I still can run Thing
and such other stuff - and can use my EtherNat, I think I will give
it a try and, then, maybe write a french "How To" for french users.

Please, tell me if I'm wrong somewhere...

Regards,

J.-Luc

No, you are not wrong.
you can have a multitasking userless GEM capable of lfn (and/or ext2
and/or Minixfs) by following the instructions in the above mentioned
readme (simple installation). Both N.AES and XaAES can start Thing
for you if you tell them to do so in their cnf files.

Though I cant tell if such a setup is enough for the ethernat.
If software expects certain users, this simple setup is not enough.

This is possible. But once again, yes, this is everything you need, no unix stuff, no ext2 partitions, no command line stuff.

> possible to boot MagiC! and let it launch the kernel by putting it
Hey, wait here. You can't of course boot MagiC! -- it's separate OS, just like FreeMiNT is. So you can't mix up these two. Either you have to boot into MagiC or into FreeMiNT. But as Henk says, all your settings (Thing, ACCs, ...) are preserved and you can use them.

About Ethernat: I admit, it's a little bit tricky. There are some files which are present in standard unix environment (configuration stuff -- like /etc/resolv.conf) and you have to copy it into some TOS partition and cut the name (e.g. d:\etc\resolv.cnf). Hell, I can't remember where I've seen this. Some guy posted his configuration for ethernat boot... yes, I know! It was on dhs forum. I'll try to search for that and post it here. It was really something like zipped 5 files which you copy to C: and here you are.

I've had Mint installed before, Installing the basic is simple enough.
You can do that with Geneva.
However, I don't like having to run a certain OS to get Ethernat.
It sounds rather PC ish.
I'm not knocking Mint, but why must it be used for this hardware
to work properly?

Finding people to code anything on an Atari now days is rare indeed.

I think I have duplicated your problem on my MSTE, I had a similar problem
the other day when I got my MSTE out of storage.

To make a long story short...
You may have to reconfigure your internal hard drive.

With the Vortex installed, the internal hard drive is seen as Unit 1 not
Unit 0.

I had all kinds of trouble with that for awhile.
Also, be sure that the Vortex is seated in the socket firmly.

I could reformat and partiton my hard drive only as Unit 1. But still the
original system disks would not install the hard drive driver.
I tried a couple versions of HD Driver, and the only one that worked for
me was version 6. It saw the drive and the partitons after running the
driver in the auto folder on the floppy disk. I then went on an configured
the hard drive. Works great now.
Also, you may have to use 4 partitons, not sure on that, but I tried 2
custom ones with the MegaSTE advanced hard drive Utilities disk
with no luck. I had to select a preset partition setup from the menu.

It took me awhile to get it working as the Atari Hard Drive Utilities would
not install the driver due to the drive being Unit 1 instead of Unit 0.
I tried setting jumpers on the drive with no luck.
The drive is the stock 46 meg Seagate.

So, I used the original Atari MSTE Hard Drive Utilitie Disk to
format and partition the drive, and HD Driver 6 to install a working
driver so that the hard drive would boot up upon start up.
I copied over the MSTE System Disk all except the shdriver.sys
and the Newdesk.inf

And it works just fine.

One nice suprise was the system Clock. It had kept the correct
time and date after all these years!
Was a suprise after seeing the trouble with other Atari system clocks.
date was shown correctly as 05/19/08.

Then stuck a VIDI ST 12 cartridge in and had some fun.

OK, let's sum-up...
I spent over 3 hours yesternight trying to have it run properly :
- copied mint.prg in my auto folder,
- copied mint folder including 1-16-1 and xaaes at the root of c:\,
- edited both mint and xaaes cfg to match my system,
- rebooted and deactivated (thanks menu6) all magic! related stuff,
- kept my fingers crossed... and
despites I correctly set up (I think) the env (home, etc, usr,
Thing, video, ...) variables, I could only get monochrom ;
I tried to set the mintnet stack to match my settings - it seemed
easy, while my magxnet config is based upon mintnet -, but, once
again, I couldn't even get the leds of my ethernec blink.
I then tried with the ethernat, and there again nothing, while
with magic at least it lit, even if it made the system crash.
With mintnet, it looks like it weren't seen by the system.

Today, as my work let me a little free time, I went browsing the net
and found that :
http://atari.st-katharina-apotheke.de/home.php?lang=en&headline=Mfl&texte=mfd
From what I understood (or, rather, what I think I understood), it
seems that the best is to run a total install. Though this site is
somewhat outdated, and maybe things changed a lot since then...
Now, just a question : I read that I would have to format a partition
as either minix or whatsoever.
Suppose I download easymint, find a free partition on my disk, format
it to ext2 and run easymint... will I be able to tell him to install
on the right partition, or will it put all stuff where he wants and
destroy my system ?
This is very important, as I can't backup my files anymore due to
problems with my scsi bus...

Regards,

J.-Luc - somewhat dummy there, I confess...

In fact, the real problem is that some developpers earned money
selling (at the time) powerful software that people bought trusting
it would last a little longer than pc stuff, then those developpers
retired without releasing their sources and because, in most cases,
the software has still commercial status, nobody can make further
development on its basis.
I mean about MagiC!, CAB, NVDI, and some others that we bought and
are still sold rather expensively though quite outdated.
For instance, I own legal copies of all three, and none of them has
evolved for 5 years at least.
That make me fell somehow a little disappointed...
And we must rely on free stuff made by people that don't earn
anything to have our machines run...
>
> Finding people to code anything on an Atari now days is rare indeed.

To install EasyMiNT, which is at version 1.70 I think, follow these
simple steps:

- read the doc. If you don't, don't go any further and just watch TV or
have a beer. Really. I'm not kidding. Don't try to install if you
haven't read the doc;
- don't format *anything*. *Set* a partition as type LNX with Hddriver
(option Change Partition Type);
- launch the Easymint installer which will find the LNX partition and
format it;
- select Falcon 040 for a CT60.
- register as a happy user to the author of EasyMiNT who is asking
nothing more for his work.

You'll then have a complete up to date MiNT setup. It is, really, quite
simple to install. I'm not just saying that it is. It really is. Go
install Windows after that and you'll see what I mean.

Cheers,
JFL

So, mr. self-appointed guru of knowledge.... what file systems should
we target for reading usb sticks? ext2? fat32? fat16? What O/S? Plain
TOS? Magic? Mint? Something else maybe?

If you don't like what people say here, why keep reading this
newsgroup?

Problem is it doesn't work like that. The FreeMiNT kernel has proper
support for device drivers, whereas TOS and MagiC has not. This, and
the fact that it's a good idea to keep APIs etc. similar to that of
the unix-world in general, means the preferred way of writing device
drivers for FreeMiNT differs significantly from that of the other two.

This doesn't mean there can't be compatibility. A good example is the
STiK API vs. MiNTNet, where compatibility has been solved by means of
a wrapper daemon.

> another OS so that they can run a piece of hardware.

An aspect that people seem to forget is that while all these OS:s
sport the same user application compatibility, they don't share the
same functionality or features internally. The FreeMiNT kernel and
recent AES:s has functionality not found in legacy systems like TOS/
MagiC, and it is sometimes difficult to write stuff without using this
functionality. What complicates things even more is that MagiC costs
cash (still), which means you can't even test your stuff without
having to pay for something which is A: essentially dead and B: you
don't want to use anyway. As a user however, you have the option to
support the ongoing development by using stuff that is being actively
developed, including the OS.

This is cool :-) The beginnings of a good old-fashioned OS war with some
personal attacks thrown in. Just like in the good old days. Usenet was so
much more fun ten years ago.

Second that. I installed EasyMiNT last year, until then I used the same KGMD-setup that I had used on various computers (Falcon, Falcon+AB040, TT and Milan) since about 1996. The quality of EasyMiNT is nothing but amazing. I don't use anything else on my Milan, except for the rare occasions where I need to test something under TOS. As long as you have 10Mb or more of RAM, I don't see any benefit in using MagiC instead of MiNT/XaAES/EasyMiNT.

MagiC has proper support for device drivers, although it looks to me that it offloads a lot more work to the driver (and the developer!) than the API used in MiNT. It also has support for loadable filesystems similar to MiNT's, but I don't know the details. They're not binary compatible though, that's for sure.

MiNT-Net and MagiXnet-drivers used to be binary compatible though. I'm not sure why they're not compatible now, as the XIF-interface doesn't appear to have changed in MiNT-net. There might be some other reason why this particular driver doesn't work with MagiC.

Indeed! Using new features AND be compatible with MagiC means adding lots of code to emulate the new features under MagiC. This means wasted time and efforts, which we really can't afford with the small number of developers left.

> cash (still), which means you can't even test your stuff without
> having to pay for something which is A: essentially dead and B: you

I'd like to test my stuff under MagiC, but will wait until some sends me a free copy of MagiC-Milan ;-) I already have a legal copy of MagiC 6.1, but that one doesn't work on the Milan.

Hi again,

I could run again my Mega STE from the Hard Drive, connectors were not correctly plugged I think.

With the Vortex:
- I can't run Install.PRG, two bombs! But, the same program from the same floppy runs well on the TT. But it's useless as I want to set the Hard drive... And partitions on the TT are not the same as on the Mega STE.

With the NOVA:
- still not working. When I unplug the board from the Atari, I have to pull using the connectors. I suspect this may have damaged some connectors. I'll try to re-solder them.

> BTW, Mplayer is really helpful.

Thanks!
What do you use it for? Playing videos or creating ones?

Guillaume.

I have installed a earlier version of Mint years ago, right when all this
Mint stuff got
started. I used Geneva for Multi-Tasking at the time and still do.
For me at the time, going down the path of Mint just didn't make much sense.
All my hardware and software worked with Geneva, some work even better.
Yes you can install Mint with Geneva to get true Multi-tasking, but I really
haven't
tried a full installation of Mint as it is today.

Question, does Mint Today, run on machines with TOS 1.4, 1.62, 2.06?
Mint Today, Good name for the software? 8-)

Question: Will hardware such as graphics boards, CPU accelerators, Cartridge
based
hardware like VideoMaster Falcon, Replay 16, Vidi ST/12 work under Mint
Today?

If it doesn't, work with the existing good hardware that we have, then I
really can't
make use of it, other than to install it on a spare Falcon I have and use it
that way.

I have Magic an original version 4.xx, and Ease, never tried them.

I have stuck with Geneva or using the original TOS simply because I know it works, and isn't a hassle, even though Geneva hasn't been upgraded in sometime,
it beats using just plain TOS if you want to run more than one program at a time.

I blame Multi-TOS for starting the trouble. It was released before it was really
useable. Everyone went Multi-tasking Crazy and thus brings us to were we are.

MiNT does not depend on TOS. However, I have not used MiNT on a 68000
since MultiTOS in 1992, so I don't know how well it performs. And 4Mb is
not much.

> Question: Will hardware such as graphics boards, CPU accelerators, Cartridge

I've used a Nova, an Eclipse and an Afterburner on my Falcon running MiNT
since 1996.

> based
> hardware like VideoMaster Falcon, Replay 16, Vidi ST/12 work under Mint

I don't know about these as I don't own any of them.

I agree, Geneva is very good. I've used it a lot myself, and IMO it's the
best OS on a 4Mb Atari. It's still very limited compared to FreeMiNT/XaAES
and MagiC > 3 though.

> I blame Multi-TOS for starting the trouble. It was released before it was

IMO MiNT has been the superior OS for Ataris with more than 4Mb RAM ever
since N.AES 2 was released.

Hello lp,
Long time NO talk! Well the old Magic and MINT battle. I am sure
this is all true since you are a coder and all and well aware of what
the ins and outs are of both OS's. But lets be reasonable here. If I
had the 1/2 the knowledge that anyone else that claims they could have
written a work around for this MagicNET on EtherNAT thing it would have
been done by now and no one would be writing on this newsgroup about not
have a driver for this card.

>
> Then a coder comes along who happens to use MiNT, and for whatever reason

> can write the magic driver. But do they? ;-))

Sure this is true but really what is programming. Me being a programmer
on the 8-bit line of Atari computers I know that programming is nothing
more than hacking a computer to do what you want. Where there is a will
there is a way.

> the old KGMD package.
>

No none of it is hard when using the EasyMINT installation. But here lies the problem. MINT does not allow the usage of some programs that were MAGIC only like Emailer, Fiffi some other ASH products. Those are great programs and I still use them to this day. So anyone wanting to use MINT has to do what? There are some cool things in Magic that I have not been able to find for MINT and vice versa. But I am not willing to dump Magic for MINT entirely, because of the lack of some of these applications. That is why I currently have the availibility to run three OS's TOS, Magic and MINT on my CT60'ed Falcon. I would like to get 2 systems running, one with MINT and one with MAGIC so that I can use both over my network.

The hand install of MINT is crazy since EasyMINT is available. I certainly would not recommend that for any beginner. Start out with EasyMINT and if you have a working setup and do not want to get rid of your existing setup you can install MINT on your current HD and partition before beginning the installation. This will all be covered in my MINT Tutorial coming soon.

Why cant this be done with this driver for MINT to work on MagicNET??
There has to be someway of getting MagicNET to work with this driver in
some fashion.

I am more than willing to help in anyway I can. I have Magic with
Jinnee setup and ready to test any programs that anyone is willing to
throw at me. Call me a beta tester to the programmers. For a living I
write procedures for my work place in a very structural manner so

desciptions of problems that are happening will be very detailed in deed. Anyone willing to work on this I have some money on the line for the project and I am sure there is several others that would join me in paying a few bucks for the effort so that it does not go unrecognized. Anyone else with me??

That is VERY interesting to know. What was coded differently in the
versions of MINT or MINTNET that would have caused a problem with the
API as has been stated is the problem??? Was something added to this
particular driver for MINT that makes it not work the same for MagicNET??

As I stated basically the same thing that you have to create a work
around to get your idea to work. There may not be a direct feature so
to speak that can be accessed but there is always a way to get anything
to work on any device if you think about it long enough.

Jo Evan I can certainly help you out testing your stuff so that it works
under Magic. Would you like me to beta test your stuff and get back to
you on it?? Anything in particular you wish me to start with?? I
wished I had the Milan version as I only have the regular Atari version.

> STE.

2 Bombs means a Bus Error. It could be that you have a hardware problem
that needs fixed on the MSTE.
Or it could be that your internal hard drive is set to unit 0 and the MSTE
is seeing
the Vortex as Unit 0 also. This will cause problems. I had this problem just
a few days ago and had to set my internal HD to Unit 1 and reconfigure it.

How big are your internal hard drive partitions on the MSTE?

I don't know if your Vortex software is the original disk and configuration
or not.
The default configuration is for NO Hard Drive, so that you can boot off a
Floppy
before setting up the hard drive.

If someone saved a non-default configuration to the software disk, then this
could
cause you problems.
You might try making a backup of the Vortex software disk and deleting the
.CFG file
and then run Install.prg.

>
> Thanks!
> What do you use it for? Playing videos or creating ones?

Both actually. I have alot of video hardware and software for the Ataris.
I'm really suprised at how good VIDI ST 12 is on the MSTE.
Full Screen Video is possible, and the Still Grabs are really nice.
No Audio digitising like on the VideoMaster though 8-(

Part of the Vidi ST 12 software works in GEM which is a suprise.
I wonder how the Nova would work with it, something to look into.
Also want to try the Toki Line software. It was suppose to be
Professional Software, went Freeware years ago.

So, one could not use Geneva and FreeMint together?

Installing Mint is something I will do in a future project, I've got too much
going on to really devote my full attention to it. And if I am going to install
it. I want to do it right, by understanding it all first. I've not taken a good
look at Mint in a couple of years.

As for the USB, I don't see why one could not develop a Cartridge based
USB adapter. This has already been done on the Atari 8-bit. I have one
of the USB Cartridges. Looks really cool, too bad no one is writing drivers
for it much.

The EtherNat/Mint thing does bug me though.
If one could just plug in the board into say a Cart or Printer port, install a disk
of drivers in a folder on drive C or run it from Drive A: I'm sure we would have
alot more people interested. There still seems to be a demand for Atari machines.
Despite the lack of support for it in some areas.

At some point the sockets functionality was moved from a device into the kernel itself. Then the relevant GEMDOS-functions has been added. However, I don't think the XIF-interface (the interface between the network device driver and inet4.xdd) has been changed, as I've used the same driver before and after this change without any problems. Also, this particular driver (DE620-driver by Elmar Hilgart) worked on both MiNTnet and MagiXnet simply by changing the filename suffix from xif to mif.

> API as has been stated is the problem??? Was something added to this
> particular driver for MINT that makes it not work the same for MagicNET??

I have no idea. Is the source code available? If so, it should be possible to fix it unless it depends heavily on some MiNT-only feature(s).

> to work on any device if you think about it long enough.

Thinking is the easy part. The actual development might not be so easy ;-) Believe me, it's quite frustrating to draw the benefits of new features in XaAES and then have to implement the same feature from scratch to be able to run the application under N.AES or MagiC. It would be so much easier if everybody just switched to XaAES (or MyAES, which is very up-to-date as well).

> Jo Evan I can certainly help you out testing your stuff so that it works
> under Magic. Would you like me to beta test your stuff and get back to

I have beta-testers, but the problem now is that I have a particular program that won't even start under MagiC. So I need to debug it under MagiC. I have MagiC on my Falcon/AB, but no space to set up this Falcon so I can't use it...

I've used Geneva 7 under FreeMiNT, but that's almost 10 years ago. I have
no idea how it would perform with the current version.

> As for the USB, I don't see why one could not develop a Cartridge based

There is no good and clean way of expanding TOS this way. You'll be
relying on TSR's, cookies and whatever. It's much easier to do stuff like
this under MiNT. MiNT is also developed and is fully open source, which
makes it possible to expand/modify the OS itself if necessary.

Floating windows. Extensions to appl_control (which again doesn't exist at
all under MagiC). Menu-widget in windows. Automatic handling of keyboard
shortcuts in forms when using form_keybd.

Well, I don't know if you're refering to network interface drivers or
to the USB stuff. The latter has nothing to do with MagiCNet, while
the former suffers from compatibility issues which are difficult to
solve since MagiCNet is nolonger developed, and the source code seems
to be closed (which is odd, because afaik it's based on MiNTNet which
is GPL).

Hello,

OK, then I'm not that dumb that I seem... ;-)
Most of my problems went from my HD, others however still occur that
seem to be SCSI-dependant. :-(
I managed to backup my 20 GB disk to a tape, then formatted a new 10
GB one with one LNX partition (lnx doesn't work, BTW!), tied it to
the IDE as Master, the old being Slave, and transfered data.
Then installed EasyMiNT and got it running in less than 2 hours. :-)
3 problems, however, so I must have done something wrong :
1- Everytime I reboot, I must use XaAES' setup to change to 256c,
VGA, PAL, etc. It seems the config isn't saved. :-/
2- Didn't find how to properly shut down the computer : only get a
"quit" option under XaAES, that asks whether to kill the still
running accessories and reboots. :-/
3- The EtherNAT's LEDs light-up, the screen displays something about
100 Mbps full duplex, but then, when I try to ping my gateway,
nothing happens. :-/
I searched to and fro on the net, but all I found was related to
serial port connecting, not LAN.
A page somwhere, on a website, that I could have missed, and that
could explain the correct settings ?

All this makes that I'm currently using MagiC! and my EtherNec again,
until I can understand what I did wrong. :-(

Hello,

Maybe because MagiC-Net is a very outdated hack of MiNT-Net, which
used to be compatible enough until MiNT-Net developpers added new
important features (not to blame the MiNT-Net developpers, is it?)
that allowed the stack to keep accurate.

Well, since it's not binary compatible then we're kind of screwed
anyway. But I wouldn't mind getting my hands on the specifications for
that stuff so I could port my joystick drivers for it (well, provided
I get access to MagiC as well).

> Indeed! Using new features AND be compatible with MagiC means adding lots

And - (no offence non-coders) - non-coders tend to claim it's just a
matter of "try a little harder". This is usually not the case, because
it means you can't rely on a particular design but need to do a "one
size fits all"-solution (which is often no way near as good as the
original design).

Me too! In such case I would consider supporting it. As things look
now I won't.

Well, and there we have it. My impression is that most of the active coders (far from all though) are using FreeMiNT. Asking them to fix it for MagiCNet won't get you far. There should be a few MagiC hackers around, and perhaps they could fix it? The driver sources are - thank god - GPL.

And btw - "programming is nothing more than hacking a computer" - I'm not sure I agree with that. In the end ofcourse it's down to 1:s and 0:s, but frankly, it's more than that.

OK, thanks.
But that wasn't enough.
Finally, I succeeded getting it working copying some data from my
MagiC-Net config.
So, it seems that for ethernet, the dialog box at installation
isn't enough to get it working straight after reboot. :-/
Now, I'm going to do some testings and read the hyp files to try
and solve the two other problems I described earlier. ;-)

> newsgroup?

Dear ggn, obviously your knowledge about Atari is not much better
than knowledge about PC, WIndows. We need only driver for USB Pen
drives. Filesystem is not so relevant. There is FAT16 support in TOS.
There is FAT32, Ext2 support in Mint. There is BigDOS for large FAT16
partitions. We need to target only low level sector access, as it goes
by mass storage.

I like some people here. I like something what is said. And not like
something. But you will ever be one who just dislike everything around
me. Really, talking with you makes bad influence on me. You are so
stupid and uninformed, that I really start to feel as guru of
knowledge :-)

you must edit c:/mint/1-16-x/xaaes/xaaes.cnf manually with an editor,
be aware "newline" character must be the unix one, QED does this
automatically. Inside the file you have info about how to set the
resolution value.

> 2- Didn't find how to properly shut down the computer : only get a
> "quit" option under XaAES, that asks whether to kill the still
> running accessories and reboots. :-/

you can open a shell/bash terminal with toswin and type "shutdown"
you can use a taskbar like ztask(is free and open source), it has an
option to shutdown the system.
Taskbar i think looks for SDMASTER an enviroment variable that you can
put in xaaes.cnf like this:

setenv SDMASTER u:\sbin\shutdown

> 3- The EtherNAT's LEDs light-up, the screen displays something about
> 100 Mbps full duplex, but then, when I try to ping my gateway,

you need to edit these two files u:/etc/sysconfig/config.if and u:/etc/
sysconfig/defaultroute

and u:/etc/resolv.conf if you want to do some internet.

also with these files be aware about unix "newline" character

So as the Easymint author thanks for an email after someone uses his software, you can send the email and explain what happend with the ethernat and he can improve a little bit more the installer supporting this card.

Ok that can be the problem. Shall I set the unit ID on both the HD
controler and the HD itself?

> You might try making a backup of the Vortex software disk and deleting the
> .CFG file
> and then run Install.prg.

Yes, this is another idea.
I'll try it.

> Both actually. I have alot of video hardware and software for the Ataris.

Okay, that's great.
Few people reports using M_Player as a video builder.
Have you seen that I added the CRAM (8 bits and 15 bits) compression?

If you want to know more, have a look at:

http://pagesperso-orange.fr/gtello/mplayere.htm to download the last version

http://pagesperso-orange.fr/gtello/makvide.htm to see my own installation
and an example of video I made with my Ataris.

http://pagesperso-orange.fr/gtello/tt_e.htm to see the program I made to use
the Vidi ST12 on the TT + NOVA.

Guillaume.

The HD must always be set to SCSI ID 0 in order to work with the Mega STE
SCSI adapter.

My hard drive was a Seagate 46/47 meg SCSI, it had no visable jumpers on
it.
The MSTE Hard Drive utilities Software, saw it as Unit 1 with the Vortex
board
installed. Now I could format and partition the drive with the system
software,
however it would not install a working driver. It would not see the drive to
install
the driver even though it would format and partition the drive.
I used HD Driver version 6.00 which saw the partitions created with the MSTE
Hard drive utilitie software, and installed a bootable driver.
This is the only way I could get it working with this drive.
I didn't try setting the ID on the controler. But did try setting the drive
to Unit 0
with jumpers. When I had it as Unit 0, I could not do anything with the
drive at all.
When selecting it to repartition, I would get a message that the drive
doesn't exist or
nothing to partition. (something like that). So I removed all the jumpers on
the drive
which sets it to Unit 1. At least with my MSTE setup. It was the only way I
could
do anything with the drive.

I started to remove the Vortex and see what Unit the drive would be without
it.
But got it working right before it came to that.

What had happen was, I had somehow messed up the boot sector on the hard
drive
with the Vortex installed.
Normally the internal hard drive would be setup working, before the Vortex
is installed.

Looking in the MSTE manual, the internal hard drive is Unit 0, so it's abit
backward.
Unless I run into problems, I'll leave it like that.

This is not correct, FreeMiNT doesn't care if the linebreaks are
Atari/DOS or unix.

> you can open a shell/bash terminal with toswin and type "shutdown"

This is correct. Also, if you're using Teradesk it can shut down for you.
There is also shutdown.app which is included with EasyMiNT.

> also with these files be aware about unix "newline" character

Yes, these files must have unix linebreaks.

I don't think MiNT is suitable for this. It would have to be modified
quite a bit to work from ROM, and even then I don't see any benefits at
all.

Aren't these related to the NVRAM? As for XaAES itself, "video=27"
in "xaaes.cnf" will boot in 256 colours.

> 2- Didn't find how to properly shut down the computer : only get a

Ctrl+Alt+H will halt the system. The Task Manager also has a Quit button
that will shut down. The accessories in question are buggy and do not
react to a shutdown message. XaAES has to kill them but asks you
politely before. This is explained in "xaaes.cnf".

> 3- The EtherNAT's LEDs light-up, the screen displays something about
> 100 Mbps full duplex, but then, when I try to ping my gateway,

Looks like a simple config issue. Check that you have your nameservers
set in "/etc/resolv.conf".

That's what I found comparing my MagiC-Net config and MiNT-Net one.
I first only focused on the files into /etc/sysconfig/, but then it
became obvious some other important files were missing.
After examining the content of /etc/ into MagiC! folders, I found
that both hosts and resolv.conf were missing. :-( And, after filling
them with correct info, all went working. :-)
I sent Marc Anton an e-mail.

> Titan/Black Scorpian run on the TT030?

Not quite sure, as I haven't used these for atleast 10 years now. IIRC
they require a Falcon, but I could be wrong.

Hi,

A few years ago I inherited the game 'Xchess' in the original box.
Unfortunately there are a few badsectors on the disk.
So I was wondering: anyone out there who has got this game and wants to
send me a copy?
Thanks in advance.
Oh I can proof by the way that I own the original game by sending a scan
of the manual or so.

There's been a version built with FPU support, instead of the DSP
support, as you can see at <http://aranym.org/scrshot/apex2.png> so
that it could run on TT030 as well. But I guess it was never released.

I personally bought and registered the Falcon030 version of APEX
Media, and would have been very pleased if it also run on Hades060 !

In any case you can have a look at the following FLI/C viewer

<http://www-ftp.lip6.fr/pub/atari/Falcon/Graphics/flictc47.lzh>

rather slow but very helpful, I tested myself.

I hope it can help.

# 3163. MiNT : time for results

Newsgroup: comp.sys.atari.st
Date: 2008-05-25 16:43:02 UTC
From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <48399716$0$897$ba4acef3@news.orange.fr>
Source record: 3431

Hello,

I've been using MiNT for a few hours now, and so I think it's time
for reporting. I must admit that, having read many posts in which
MiNT users praised all the advantages of MiNT vs MagiC!, I always
thought all my problems would be solved when switching to MiNT.
It took me 4 years before I mad up my mind and, so far, I must say
I never saw my system crash so many times in so few time.
I own a CT60'ed Falcon running at 96 MHz, but the crashes occur at
72 MHz too, doing things so easy that typing under QED.
Last night, I counted more than 30 crashes in 1 hour. Some times
XaAES decided to hang, some other times it happened when opening
QED, or HighWire, Troll, Litchi, Arcview or even a drive.
Each time, no way to resume, had to reset.
I deleted every program or accessory that I read was known to make
the system unstable - as Bubble Gem, for instance - and the only
one that I know still being active is Xcontrol, which I have no
other to replace with.
I hate those crashes that happen with no reason, and that disappear
just as they came, without letting us find what happened. :-(
As I'm there, I've got some questions I'd like an answer to or, even
better, a link to explanations - I've been reading so many things in
so few time, that I *must* have missed something - :
1- despites the keytable.tbl that i built and put at the same place
as MINT.CNF, my PC keyboard behaves like an original ST one. :-(
2- TTP's and TOS' don't launch anymore, despites XAAES.CNF containing
the following lines :
------------------ START ------------------
setenv TOSEXT TOS,TTP
setenv TOSRUN u:\opt\toswin2\tw-call.prg
launcher = u:\opt\toswin2\tw-call.prg
run u:\opt\toswin2\toswin2.prg
------------------- END -------------------
As a consequence, I can't (un)pack archives, build guides, aso.
3- Kobold seems to have problems too, that I will try and define
so i can describe them correctly.
4- the Home folder seems not to be used.
What is the "usehome=yes" line for ?
Wouldn't there be a line like "setenv HOME <path-to-homefolder>"
somewhere in the cnf ?

Yes, I know, that's a bit long, but I didn't find answers to those
questions - even on http://xaaes.atariforge.net/index.php - so far.

Regards,

J.-Luc

Then something is wrong with your setup. Could you post a complete (unsorted) list of your AUTO- and CPX-folder? And also a copy of your current mint.cnf and xaaes.cnf? MiNT runs very fine on CT60, I know several people that are using MiNT on the CT60-Falcons. Also, both the main developers of FreeMiNT (Frank Naumann) and XaAES (Odd Skancke) own and use CT60-Falcons.

> the system unstable - as Bubble Gem, for instance - and the only

I use COPS on my Milan. Haven't used XControl since around 1996.

> I hate those crashes that happen with no reason, and that disappear
> just as they came, without letting us find what happened. :-(

Do you have TosWin2 running and with the console window open? Is there any debug output from MiNT or XaAES when this happens?

> 1- despites the keytable.tbl that i built and put at the same place
> as MINT.CNF, my PC keyboard behaves like an original ST one. :-(

It's keyboard.tbl, not keytable.tbl, and I see that I've got it wrong in the docs for KeyEdit. You can use KeyEdit to edit the keytable, it's available for download on my web-page (http://atari.nvg.org/).

> 2- TTP's and TOS' don't launch anymore, despites XAAES.CNF containing

Looks correct, as long as the paths are correct. It could also be a problem with the settings in your desktop. What desktop do you use?

> 3- Kobold seems to have problems too, that I will try and define

What kind of problems? Kobold doesn't understand anything but plain FAT16, on any other kind of partitions it falls back to GEMDOS.

> 4- the Home folder seems not to be used.
> What is the "usehome=yes" line for ?

It tells XaAES to include $HOME in the search path used by shel_find().

> Wouldn't there be a line like "setenv HOME <path-to-homefolder>"
> somewhere in the cnf ?

Either in xaaes.cnf or mint.cnf.

BubbleGEM runs fine here. Anyway, something is very wrong with your setup. Are you sure you are running the 060 versions of mint.prg and xaaes.km? No mix up? Also, have you removed the MagiC patches? I remember there were a lot of those when I received my Falcon.

In addition to all the above I found that installing NVDI greatly
improves stability on my CT63 Falcon. Probably because it disables the
blitter.

Make sure, you have execute right both on "u:\opt
\toswin2\toswin2.prg" and "u:\opt\toswin2\tw-call.prg". Easymint
installs them without granting execute rights.
```

It's running in background and, when those crashes occured, I couldn't
do anything than press the reset button. :-(

>

Well, this is taken from KeyEdit Hyp :

```
-------------------------- START QUOTE -------------------------
FreeMiNT >= 1.16 will look for a file called keytable.tbl
in the current system directory. To use your edited keytable, save
it inn the MiNT directory and name it keytable.tbl.
FreeMiNT will then load this keytable and use it at the next boot.
-------------------------- END QUOTE -------------------------
```

Seems to work better, now that I renamed it the correct way. ;-)

As my MiNT setup isn't stable yet, I'm very happy I still can switch
to MagiC! when I need to (un)pack files or run any TOS/TTP program,
that don't under MiNT.
So any stuff related to MaciC! is still there, but deactivated thanks
to Menu6 when booting.

it looks like tw-call.prg doesn't have the execute rights enable, you
can set them from THING, select the file and right click with the
mouse on it, then in the popup menu select "show info" or "zeige info"
in german and select "atributte"....
```

Hi J.-Luc,

Sorry to hear about your problems! I looked quickly at your list and have a few comments for you. Hopefully you'll find the source of the problems, since this is indeed a very stable system and it really flies on a 060 machine.

> 3719 May 25 10:32 ct60xbio.prg

AFAIK you shouldn't run this on a freemint setup.

> 315800 May 25 10:32 mint040.prg
> 320850 May 25 10:32 nvdi.prg

Not sure, but I think NVDI should go before the mint kernel.

> exec c:\mint\68882.prg

Hmm... I know I need this on the Hades, but I don't think this should be executed on the CT60 since this stuff is available in the CT60 TOS. Can anyone confirm this?

> >> Wouldn't there be a line like "setenv HOME <path-to-homefolder>"
> >> somewhere in the cnf ?

Which kind of EasyMiNT install did you make? I have a "login" install on both my machines, i.e. I have to enter user and pw when I start the machine, then I start XaAES manually from the command line. In this case the home folder should be handled automatically (note however that since XaAES is a kernel module, you'll need to start it using sudo unless you're a root user)

I assure you I run ttp/tos programs on daily basis and I use just
standard easymint configuration... strange that execute permission
isn't set, I had never problems with that. the same for $HOME
variable, are you sure you're looking into right place? (<your ext2
partition>/root) I never set this variable manually...

Your second problem (instability):

1. Use NVDI. I don't know why exactly but it seems original VDI uses
blitter -> XaAES uses VDI -> XaAES crash as soon as some blitter
access occurs.

2. mint.prg should be the last program in auto folder. and please,
remove that mupfel.ttp, this is asking even for more problems :)

Hi,

> 1- Everytime I reboot, I must use XaAES' setup to change to 256c,
> VGA, PAL, etc. It seems the config isn't saved. :-/

Nope, they are not. Edit xaaes.cnf to set a default video mode.

> 2- Didn't find how to properly shut down the computer : only get a
> "quit" option under XaAES, that asks whether to kill the still
> running accessories and reboots. :-/

There are several ways to shutdown the system
- Task manager (control+alt+escape) IIRC
- Command prompt (type "shutdown")
- Some desktops
- Some taskbars (i.e. "Taskbar")

> 3- The EtherNAT's LEDs light-up, the screen displays something about

You're 100% sure that your TCP/IP configuration is correct?
Also, did you put enter a mac ID for the card in ethernat.inf?

Is this necessary on the CT60? I'm not familiar with the CT60 firmware,
but I had the impression that the FPU-emulator is installed by the CT60
booter. Do you have to run 68882.prg when using TOS or MagiC?

> exec u:\usr\sbin\gluestik

It's worth commenting out this one unless you're actually using
STiK/STiNG-clients.

> > Do you have TosWin2 running and with the console window open? Is there any

Ok, so no error message in the console window?

Yes, as I said, I got it wrong in the KeyEdit docs...

Exactly. If you want USB pen support, start coding. Don't give me the
"uuh I don't know how to code"-thing, because I didn't either a few
years ago. Don't wait for others to fix it for you.

HOME is set, but doesn't contain a value. That's why it's not used. I
suggest setting it in xaaes.cnf, and use a DOS/TOS-style directory. E.g.

setenv HOME d:\home\

You can use the same HOME as under MagiC, then you'll keep your settings
between MagiC and MiNT.

Control+Alt+L

You can also halt the system with Control+Alt+H.

> - Command prompt (type "shutdown")
> - Some desktops

Teradesk will shutdown correctly, and also power down when running on a
CT60.

> - Some taskbars (i.e. "Taskbar")

Taskbar just runs the program pointed to by $SDMASTER. So in order to be
able to shut down from Taskbar (and other programs evaluating this
environment variable) SHUTDOWN must point to a shutdown program.

Mint is actually the very last program. The list I posted is sorted,
I made it using the ls command.
About mupfel : why should it cause problems, since it isn't run,
unless ttps can be autorun from the auto folder...

Thanks,

Troll, MyMail, Litchi ?
I needed glueStik to use them under MagiC! - though I'm quite sure
I could use MyMail straight with MagiC-Net at beginning, so there
must be some changes since then -.
I'm going to test without this line.

MyMail and Troll need this, while HighWire uses it's own MinT-Net
ovl and runs fine on its own

Bizarre, j'utilise MagiC mais sans Gluestik, il faut dire que c'est
STinG et non MagiCNEt ;)

One tip : no need to launch gluestik at boot sequence. You can start
gluestick just before sucking the Litchi or throwing the Troll ;)

> find much info on this online. Any idea as to the rarity of this
> emulator or what it may be worth? Thanks in advance, deebee...

*personal* recollections. While it is an interesting little piece of history the mod was not very popular at the time. I seem to recall that it let you run several pieces of software like Lotus 123 which were expensive ~$300 at the time and pretty much standards in the industry.

There was at least one PD spreadsheet that I used on my ST and by the time the emulator came out, the prices of clones had dropped to under $600 so most people went that route. I was probably only one or two the people in the company I worked for at the time who actually bought Quattro for ~$100 vs. get a cracked copy of 123 for home use.

The thing is you wouldn't want to run Lotus 123 or Word Perfect or any other software on a PC, too slow. Michtron came out with an AT Speed but it sufferred from the same price pressure from the clones.

Prices are typically high on vintage stuff because ~some aging white guy remembers the Honda CR250 or running Dungeon Master on his ST. Unfortunately no one looks back fondly about running a spread sheet on his ST.

Hello,

Do some of you use large (>15 GB) hard drives with more than 15
partitions ?
I'm having problems with such drives : when I first partition
them, it's ok, but then if I want to change partitions type or
even repartition, they cause the system freeze, no matter the OS
and the processor (it happens on plain TOS, MagiC! and MiNT, and
in 030 or 060 mode - I tried all the cases -.). :-(

Just lost another last minute bidding war for a STacy. :(

I swear, I don't think I'll ever get one - and buying one from Best
Electronics or B&C Computervision (as much as I like them) for $799
-899.00 seems a bit steep.

Guess I'll just keep on looking for one.

BTW, how many STacy's were actually produced? Thanks.

Source record: 3311

Hello,

With the help of Olivier Landemarre, I am translating his work on SCREEN.LDG
into assembly.
I need some testers becaus I don't have every screen mode at home.
The test is easy (through KRONOS).

Everything is explained on my page:
http://pagesperso-orange.fr/gtello/screen.htm

Thanks for some feedback!
Mostly on Falcon modes and if someone has a graphic card with 65536 colors
(not 32768) and a Matrix with a 16 colors mode!

Guillaume.

I know about a Stacy here in Norway. It's one of my old ones, got 4Mb and
a good backlight (which is pretty rare for a Stacy, as the backlight EL
film burns out after a few years). If you're interested I can ask the
owner if he wants to sell it.

> Guess I'll just keep on looking for one.

I've got two, both broken beyond repair. As soon as I find a good 9"
colour LCD monitor, I will turn one of them into a PC running ARAnyM ;-)
I've already converted the keyboard.

> BTW, how many STacy's were actually produced? Thanks.

I have absolutely no clue, but considering the price I would guess that
not many where sold. In Norway I think that less than 20 where sold - I've
owned three of them and know about two others.

15-20 GB is not so big issue to partition.
But with some new disk you are forced to make some other partition
types than FAT16. Then we coming to FAT32, Ext2.

I partitioned 160GB drive to some 10 FAT16 and couple FAT32 parts.. It
works flawless in Windows XP, but with Mint I had troubles. It looks
that we have some limits around 32GB, but it depends from cluster size
too. Above that limits different errors appear. Has someone positive
experiences with verz large FAT32 partitions and Mint?

PP

OK, it seems I didn't explain the problem correctly.
One can partition a disk in whatever the number one want and use
it without any problem either with MagiC! or MiNT. Mine worked
fine for a couple or years.
But then, for installing MiNT, I needed to convert a partition
to LNX, which is quite easy with HD-Driver : just select "Change
partition type" from the menu bar, then click on the drive you want
to work on, and it dispalys the current partitions scheme, total
disk, used and free space along with the drive name and model.
This indeed behaves this way for up to 15 partitions - I checked
yesterday -, but with more than 16 partitions it definitley makes
the system freeze, even if you only try to repartition the drive.
- if you simply want to repartition, the partition scheme is totally
wrong, displaying an impressive number of partitions of random
sizes, and erroneous data. For instance, when I divided a 4 GB -
yes, I did wrote 4 GB, it isn't a typo! - into 17 partitions of
235 MB, restarted the system, then tried to partition it again, It
displayed 26748653 as the capacity, 16854851 used and 51816753
free space, and more than 30 partitions of irrelevant sizes.
- if you try and change a partition size, after you select the drive,
first it doens't display the correct drive name and model in the
box which you select the partition in, but then, whatever you do,
the system freezes and all you can do is restart your system.
So, yes, you can split an IDE drive in so many partitions you want,
and yes, it will work fine for as long as you don't try to change

anything regarding the partitions. But otherwise... :-/

From your description this sounds like a problem with hddrutil, and not
the driver itself. You should report this to Uwe Seimet.

Source record: 3324

Hi,

A first test from Jean-Luc C. (merci!!)
On a Falcon CT60 with 256 colors:

MACHINE=FalCT60 96 MHz / 25 MHz MiNT;
VDI=NVDI 5.3;
SPEEDO=Yes;
SCREEN=1024*768 8bits (8EC:0);

With the previous LDG:

OPENGL_SCREEN_PLEIN=221.060; (img/min)
OPENGL_SCREEN_FILAIRE=169.014; (img/min)
OPENGL_SCREEN_POINT=246.120; (img/min)

Pseudo OPENGL perf : 3.251 (video dependant)

With the new one:

OPENGL_SCREEN_PLEIN=371.463; (img/min) so + 68%
OPENGL_SCREEN_FILAIRE=244.508; (img/min) here + 44%
OPENGL_SCREEN_POINT=450.176; (img/min) and there + 83%

Pseudo OPENGL perf : 5.133 (video dependant)

The results without screen don't change in OpenGL (a 3% variation, not
more).

So I'm happy!
This routine given by Douglas Little for M_Player some years ago is
really precious in 8 bit planes.

The routine in 4 bitplanes (16 colors) should be accelerated too, and
maybe in true color some little improvment I hope.
Someone to test?

Guillaume.

Hello

I just add, screen.ldg is most of time use to display 24 bits RVB
picture to any video dependant format (from 1plane to 32 planes, at my
known all video formats used in Atari world are support and even
more). This is too a screen video format detection before I know the
Eddi cookie exist!
It is used in MyAES and some other of my own softwares. As Guillaume
said it's too possible transform from any dependant format to 24 bit a
picture.
Notice that from 24bits to 8bits screen.ldg use the user palette of
the VDI, and use all the 256 colors in it, I use it to display Cicon
in MyAES because I transform Cicon from 16 colors to 24 bits truecolor
to finally display it in 8 bits with no lost.
Screen should be able transform picture from independant format to

dependant too but I'm not sure I have correct it, because I find it was buggy in MyAES and probably I not correct it after (I have to look for)

Olivier

>> into assembly.
>
> Just curious - what exactly does screen.ldg do?

It's a dynamic library that provides routines ton convert any source
image into any destination image using an temporary 24 bits buffer.
For example, you can have an image 1024*768 16 colors, interlaced bit
planes (the Atari encoding)
You can display it into a 320x480 TC on a Falcon with that library
calling:
1) 16 colors to 24 bits
2) resize 24 bits to 320*480
3) 24 bits to 16 bits falcon
4) then display.

Any other combination is possible.

This library is used by Kronos (Atari Bench), by Eureka (Maths program)
and, in the future, in a clean VDI version of M_Player.

Guillaume.

Actually, my preference is for Jinnee. The reason I was asking is
because, like the other products from ASH, Jinnee is no longer being
supported/updated, therefore I'm a bit concerned as to it's future
viability.

FOR SALE 2 STACYS
-------------------------

I have 2 Stacys here.
One 4 meg unit with 20meg hard drive, works fine.
Loaded with software.

The 2nd one works, a 2meg unit, but needs a hard drive.
I have the second one apart and was going to replace the hard
drive but haven't gotten around to it. It also needs the TrackBall
replaced. Just the ball, the trackball unit works fine for it.

I have both working powersupply units that go with them

I am putting both up for sale right here, right now.
One can easily repair the 2nd Stacy, buy just added a
hard drive and a track ball. The trackball got lost after
taking it apart, but I may be able to find it. All other parts
for the 2nd Unit are included, just need to be put back
together. This unit worked when it was together except for
the hard drive which is bad.

Or you can use the 2nd unit for parts, but both need to go.

If you needs pics, let me know and I'll grab my camera and
take some snaps. Both are in good clean condition.

Submit offers to me at: phantomm@suddenlink.net

In the past I have searched for this program.
And have been told that it does not exist.
However, I have read references of people that have
used it.

I have Falcon with Expose', and to my knowledge,
ChromaStudio supported the Expose board.

So it would be of most interest to me, if I can obtain
this software.

I will pay reasonable amount, if need be.

Anyone know anthing about it?

Source record: 3340

1. Complete working 4meg Stacy with 20 meg Hard Drive.
Loaded up with Software, including working PowerSupply.

2. Second Atari Stacy with 2 megs and (bad) 20meg Hard Drive.
This Stacy is currently apart ready for a replacement Hard Drive.
And for upgrading if you want.
You will need a replacement TrackBall, if I can't locate it.
Normally around $5-$10 last time I checked with Best Electronics.
Includes working PowerSupply. And all parts and etc to put back
together or use as a parts board. The Hard Drive Controller looks to
be the same one used in the MSTE or is very similar.
*Can be easily put back into a nice working STacy.

Both are carefully boxed and stored.

Would like to sell both STacys to one person.
But may split them up, If both sell.

Both have TOS 1.4 Socketed (2 chips).

Rare Machines and both are in very clean condition.
No Screen Scratches. And outer Case on both are in
nice condition. No cracks.

Pictures will be provided upon request.
For more info and to make a offer contact me at:
phantomm@suddenlink.net Put STacy in Subject or just reply to this post.
I'll be taken offers on these for a short time, so if seriously interested
do let me
know. Will Ship Overseas if you pay Shipping.
I will accept, Cashiers Check, Money Order and other if from OverSeas.

I don't think the installer/configuration software is free. Also, there
are some ethernet-drivers (ISA and PCI NE2000) on this disk that are not
free.

On 22 May 2008 19:25:42 , Jo Even Skarstein wrote:

>MiNT does not depend on TOS. However, I have not used MiNT on a 68000
>since MultiTOS in 1992, so I don't know how well it performs.

It doesn't.

Mint (and XaAES) utterly stopped working on 68000 quite some time ago.
There was then made a once-only 'special' release of 68000- compatible
mint kernel and XaAES that worked on 68000 again, and the release was
accompanied with commentaries saying that some bugs had to be fixed in
order to make the software work on 68000 but that the future support
for the said CPU will be dropped and the 'special' reelase will not be
developed further.

The implication, as I read between the linew, was that there were
bugs that manifested only on 68000 and, by dropping the support for
that processor, there was no need anymore to fix them.

regards;

Hey, thanks to you two for the info. I feel what your saying about the nostalgia value of firing up the old PC emulator and running Lotus 1 2 3. Thanks for the link to the system disks. Fortunately, I have some copies that came with the setup. I tested everything out and she works pretty slick. Unfortunately, I don't have the room to keep it at this time. I decided to throw it up on the Bay. I've been a Commodore guy for 20+ years, but I was pretty excited to mess around with this ST for a bit. Hopefully it will go to a good home (you Atari guys are as fanatical as us Commodore guys, especially when it comes to rare/oddball hardware. You can check it out on ePay if you'd like. The item number is 140236618398. Once again, thanks to those that provided info. deebee...

> Where can I find Dev-Pac DSP for the Falcon with manual?

I found mine on Ebay. However... apparently this package was crap (at least that's what most DSP coders say).

There are free alternatives around, which are supposed to be much better:
http://dhs.nu/files_code.php

The DevPac DSP manual doesn't really offer much, except a couple of examples perhaps.

# 3234. ACC in ST cartridge port

Newsgroup: comp.sys.atari.st
Date: 2008-05-28 16:54:07 UTC
From: pp <ppera@ppest.org>
Message-ID: <eff2b5a9-3085-4060-9856-a83734018e6c@y38g2000hsy.googlegroups.com>
Source record: 3252

I tried to add desktop Accessory in cartridge, according to
description in Atari ST Profibuch.
There stays that bit 29 of CA_INIT must be set for ACC. Executables
work fine from cartridge, but ACC not. Actually, it never reaches
start point of ACC prg. , crashes before. Tried in TOS 1.02, 1.04 and
2.06 . Something is wrong in RAM allocation, as I could see tracing
crash.

Does someone knows more about this?

Has someone cartridge with some ACC on, so we can see how it's header
should look ?
It is easy to make image file of cartridge ROM content... (See in
Steem)

# 3235. MiNT / XaAES cfg files

Newsgroup: comp.sys.atari.st
Date: 2008-05-28 17:43:51 UTC
From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <483d99d7$0$844$ba4acef3@news.orange.fr>
Source record: 3253

Hello,

I thought configuring environment in MiNT would be very similar to
wht I did for MagiC!. Unfortunately, I must have done many things
wrong, as it doesn't behave the way I thought it would. :-(
First, I wanted to use I:\Home as the home path, but in spite of all
my attempts, when I type either "env" or "set" into the shell window,
it reports "/root" as being the home path.
Then, I wanted to be able to shtudown the system easily, so I put
both TaskBar and ShutDown applications into folders and added what I
thought to be suitable lines into the CNF files, but there again I
must not have undertood the good way to do this, as xxxxxxxxxxxxx
Edit : well, now the "Shutdown" option appears in the menu, while it
kept greyed until I started writing this! :-/ Murphy ? :-/
So, forget this one. :-/
OK, this was the third point : within freemint 1.16.1 distr, there's
cops.app. If I rename it as .acc and put it at C:\ root, it only
displays 2 among the 7 currently ativated cpx.
Then, if I rename it .app and add run c:\mint\cops\cops.app, it's
launched at startup, in foreground. :-/
How do you, experienced users, use this control pannel ?
Here are my cnf files, please report anything bad.

```
--------------------------- START MiNT.CNF ------------------------------
SLICES=2
CACHE=4096

shell = c:\gemsys\thing\thing.app
run c:\mint\taskbar\taskbar.prg
# run c:\mint\cops\cops.app
--------------------------- END XaAES.CNF ------------------------------
```

And, BTW, where can I find a list of all environment variables used
by MiNT ? The hyp files within 1.16.1 don't say much about this. :-(
I read many other docs on http://sparemint.org/sparemint/index.html
and http://xaaes.atariforge.net/docs.php?chapter=contents.htm for

instance, but there again didn't find what I searched for. :-(
No success either with google and "mint environment variables", but
I found this : http://perl.asylog.net/perl-all-en-5.8.5.pdf ;-)
Well, some links to pages that could help me learn by myself ?

Regards,

J.-Luc

# 3236. [FS] VME Matrix M128 graphics card

Newsgroup: comp.sys.atari.st
Date: 2008-05-28 18:06:34 UTC
From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <483d9f29$0$903$ba4acef3@news.orange.fr>
Source record: 3254

Hello,

I won it on ebay some times ago, but couldn't use it as I miss the
monitor. Its a VME board, and a stick on it mentions "monograf".
From what I grabbed, it must be a mono 1280x960 graphics card, only
suitable for TTM 19x monitors, and not a VGA colour one. :-(
Whatever the amount I'm offered for, I will manage so as S&H do not
exceed 8-10 in the worst case and will send with receipt.

Regards,

J.-Luc

The first thing i see that looks incorrect is the way you declare env
variables in xaaes.cnf:

home = i:\home\

it should be:

setenv HOME i:\home

```

See below.

> Edit : well, now the "Shutdown" option appears in the menu, while it

Taskbar only evaluates this environment variable at start-up.

> How do you, experienced users, use this control pannel ?

I launch cops.acc, and have no problems with this. Might be different
versions though. I'll check which version I use when I get back home.

> setenv HOME u:/i/home

I don't recommend setting $HOME here, as it's set by init when you log on.
When you log on using init, the home directory is set in /etc/passwd. And
I'm quite sure it's set to "/root" for your root-user. So when you set
HOME in mint.cnf, it's overwritten by init. If you set HOME in xaaes.cnf,
you overwrite the contents set by init, but the proper way of setting HOME
when using init is in /etc/passwd.

> ------------------------- START XaAES.CNF -----------------------------
> home = i:\home\

I don't think "home" is a keyword in xaaes.cnf. Use setenv to set the
contents of an environment variable.

> run u:\opt\toswin2\toswin2.prg

I prefer to autostart GEM-applications from the desktop or using Taskbar's
"Startup"-folder. The reason is that apps started from xaaes.cnf are
started before the desktop/AV-server, and many apps are not able to
properly detect and register with the AV-server in this case.

> And, BTW, where can I find a list of all environment variables used
> by MiNT ? The hyp files within 1.16.1 don't say much about this. :-(

I don't think MiNT itself evaluates any environment variables.

Well, the discussion was about the EtherNat & USB, and the current
Ethernet drivers for this card are written for MiNTNet, hence it would
be natural to get these drivers working in MagiCNet.

Well, as a matter of course there're ethernet drivers written for
MiNTNet, STinG, MM (MacSTip) and M_PC (In2Cat.dll) but implies this
anything to USB drivers? Or should MiNTNet IYO be responsible for USB?

The version I refer to is 1.09... I thought its development had stopped
at 1.07 or 1.08... :-/

So, you mean that I have to change it for the root user ?
I'll give it a try.

OK, then I'll re-read the hyps of Thing and Taskbar and find this
method you write about.
>

```

Well, but they are obligatorily evaluated by some part of the system,
aren't they ? And there must be somewhere some description of what is
what and what does what - it must!

No offence, but I believe you just missed the point of the whole
discussion.

The CVS-version is adapted to GCC, I don't think there are any other changes. I use 1.07 from 1998 though, works fine on my Milan. I have not tried the CVS-version simply because I've had no problems with the old version.

> So, you mean that I have to change it for the root user ?

Yes. XaAES runs as root with the boot method you use.

> > I don't think MiNT itself evaluates any environment variables.
> >
> Well, but they are obligatorily evaluated by some part of the system,

Not anyone besides the one already in your mint.cnf. The kernel doesn't evaluate environment variables, but some tools do. I don't think there are any variables that MUST be set. On my setup I've only set PCONVERT (which tells MiNTlib which environment variables to convert to use slash as directory separator), UNIXMODE (which sets some compatibility features in MiNTlib) and PATH . I would assume that these are documented in MiNTlib, but I really don't know as I've never needed to modify these (except from PATH which just specify the standard search path(s) used by the shell).

Hmm.. I don't know if this would be what you are looking for,
but the TimeKeeper Cartridge (Cartridge Clock) Had an .ACC
so you could change time/date and or display time/date.
I still have it here.

hello , this is an unexplored area for me and my st!!!! steem !!!

with the help of you i have discovered, good good,
but what is the st cartridge image???

can you email me one , i do believe they differ from a ordinarry st
image....

maybe there is a small possibility only programs can be run from the
cartridge port?
but i will wait for a st cartridge image to arrive then begin some
tests...

i can program fairily stable on the st , enough to lauch a movable
resizeable window as an accessory, but i donot have the profi-buche

to instigate any furhter addresses or calls,,like the one you
mentioned..ok
charles

Omikron Basic wasn't/isn't an ï¿½old basicï¿½ in my opinion: It has got
modern procedures/functions (gosub), can call AES/VDI and has got a
compiler that generates speedy code.

Why do you mean ï¿½oldï¿½?

Regards
Gï¿½tz (who favors GFA-Basic over Omikron)

# 3255. TeraDesk 3.96 is available

Newsgroup: comp.sys.atari.st
Date: 2008-06-01 10:36:54 UTC
From: vdjole@EUnet.yu
Message-ID: <g1tu45$qsm$1@news.eunet.yu>
Source record: 3273

Version 3.96 of TeraDesk open-source desktop for the 16-bit and 32-bit lines of Atari computers is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This release brings fixes to some noncritical problems that were detected and a now feature related to formatting of floppy disks. Work on some other fixes and improvements is in progress, but it was felt that what has already been done should be made available to the users without waiting for other changes to be finished. See the development history file for details.

Have fun.

Ah, didn't know this one. I thought Omikron was the only Basic for the
ST that was first delivered on a ROM cartridge, then on a disk. I stand
corrected.

> But since you bring it up, yeah omikron is *old* and discontinued since

Yes. All it is old...
I just want to try it. Documentation is pretty limited. Who knows,
maybe it is never made. I looked into TOS (2.06) little, it checks is
extension ACC, and if yes., comes some weird code, what results in bad
Malloc, and later address error.
Tried every possible parameters in cart. header... It is maybe
unsupported, buggy, or just DOCs are incomplete. All DOC just mentions
that bit 29 is set for ACCessories in CA_INIT field of header.

O'Really? Well, MiNTNet has in actual fact IMHO to do as much with USB drivers as STinG, MacSTip or In2Cat.dll...

thanks for the info, the DSP chip on the Falcon is what I'd like to
do some programming for. I have some Tech info on the chip, but
as to what software package to use I really didn't know.

I remember the DevPac being released, I figured it would be the way to
go. Guess not.

## 3261. Atari bits on ebay

Well none of that has anything to do with USB drivers. The original
discussions were about USB, viable driver solutions, and the famous
MagiCNet vs. EtherNat incompatibility. You contributed by stating that
noone use MagiCNet.

The cartridge drive is old stuff, I've seen it (or a very similar
solution) before. I'm a bit curious about the USB mouse interface though,
there were very few details in the ad.

I figure its a variation of the IDE interface or similar.

I'm a bit curious about the USB mouse interface though,
> there were very few details in the ad.

No pics either. I'm thinking it is just a PS-2 interface with a USB
header to allow modern USB/PS-2 mice, rather than a genuine USB interface.

Hi Mark!! :-)

It would require a host of drivers and open development, and plenty of input from others. Such that it wouldn't just appear out of no where. And where would it be plugged? Either the cartridge port or the AHDI port. For a USB port to survive on the ST (and be adopted), it would have to be widely and publically documented. Possible? Yes. Likely? No.

It'll almost definitely be a hack of Tom Kirk's original design. http://members.aol.com/tgkirk/ps2mous.htm (these have been floating about on eBay for quite a while now, shipped from Poland)..

Aly

Nope! That's not the issue...

---------- <nibble here off> ----------
> > I know that programming is nothing more than hacking a computer to
> > do what you want. Where there is a will there is a way.

Well, and there we have it. My impression is that most of the active
coders (far from all though) are using FreeMiNT. Asking them to fix it
for MagiCNet won't get you far.
---------- </nibble here off> ----------

ï¿½ <8ae7bffc-4343-4747-a43f-bf2fc5de2b01@2g2000hsn.googlegroups.com>

The main problem is that none of the the few active FreeMiNT coders is
willing to look over the rim of his tea cup!

> You contributed by stating that noone use MagiCNet.

And that's the absolute truth - most MagiC hackers use MM or M_PC...

Well, after all, it was the topic for this thread - "EtherNat & USB
drives"...

> The main problem is that none of the the few active FreeMiNT coders is
> willing to look over the rim of his tea cup!

Well, we've been over this before. If the overwelming majority of all
coders on the planet use some form of MagiC, how come we haven't seen
any EtherNat drivers for MagiC yet? How can that be, Fidel-Sebastian
Hunrichse-Lara? Is this the fault of the "few" narrow-minded FreeMiNT
coders who are not willing to look over the rim of their tea cup?

> > You contributed by stating that noone use MagiCNet.
> And that's the absolute truth - most MagiC hackers use MM or M_PC...

And how does that help people get USB & network drivers for their
EtherNats and NetUSBees?

It is nothing really new, folks. IDE IF is well known Paskud, just
this time with CF card (they are really cheap now) .

USB mice adapter is also not new. It is in fact PS2 adapter, but as
USB mouses use PS2 protocol, it is just with USB connector. Myself
made it in one afternoon (there is complete DOC on WEB for building -
1 Pic plus couple resistors is all what is needed) .

Not all mice use the PS/2-protocol. I've tried a wireless USB-mouse on my
Milan using a USB->PS/2-adapter, and it didn't work. I've also tried a
wired optical USB-mouse which didn't work. A Microsoft wired USB-mouse did
work with the same adapter though.

A lot do, but some don't. MS ones tend to be dual. If you buy it with a
PS2 adapter you're home and hosed.

Mark

Does the Falcon have any setting in NVRAM or on the
mother board for the amount of RAM it came with from
the Factory?

I have upgraded a few Falcons from 4megs to 14megs using
different 14meg Ram boards.

I ran into a weird, problem the other day with a Falcon that I
had in storage, the only way I could get it working was to
install the 4meg Ram board.
Then after, reinstall the 14meg board. Works fine now.

No it doesn't. However there are after market simm boards that require jumpers set. I have the Actionsoft and Chromagic Ram Gizmo cards. Both require jumpers for 1/4/14 meg.

You may have just had a bit of oxidisation on tho socket or pins. Installing the other card may have just removed some of the tarnish enough for a better electrical contact.

not really an answer to your question but:
(Free)MiNT has evolved a lot since then. I don't think there is much on
that CD that hasn't been surpassed by better and newer versions ?

If you mean background images in windows, you need version 1.29beta,
available only, officially, from the Author, and only in German.

The problem I ran into is with the IDE hard drive.
I had a old Factory IDE here, that I put in a Falcon.
It was working when it was stored.
Now, when installed the Falcon will not see it unless
I have a HD Driver Boot Disk.
(Displays the IDE make but will not boot the drive)
I have tried using AHDI.PRG in Auto Folder on a
Disk. Which helped get it started when I switched
Memory boards. As Boot up is Faster with a 4meg
board. Unless you hit space bar.
But it still will not see the partitions.
With this drive installed, it causes the disk drive
not to work. I'll get a message that data on the
disk is damaged for any disk I try to read.
And it will not boot from Floppy, with this drive
installed!
If I remove the ribbon cable from the IDE, then
It will boot from Floppy.
I tried current versions of HD Driver to try getting it
going.
Well after much work, I did get it working. then, shut it
down and re-booted (cold) several times. Worked fine.
Left it alone for 2 days and same problem returned.

The IDE HD is probably Bad, unless there is something in
NVRAM thats gotten screwed up.
The IDE HD is rather old, I'm not worried about losing it.
But does raise concerns with these older ide drives that
are around.
I'd like to know for sure, that's its the IDE hard drive
and not something in NVRAM.

Does the NVRAM have anything to do with the Falcon
seeing the IDE?

And doesn't the Falcon suppose to check the IDE before
looking at SCSI?

It seems that the Falcon is looking at SCSI first, then IDE
which I think is wrong if you are booting from an IDE.

Have a question, When the Falcon Boots up, does it suppose
to display a message showing the Falcon's ID number?

Or does this depend on what type of Driver Software
that you are using?

I know that normally you get a message displaying type of
IDE/SCSI.

yes, always.

>
> It seems that the Falcon is looking at SCSI first, then IDE

It shouldn't be. The only way you can do that is with a boot floppy
where the boot sector forces it the other way round.

>
> Have a question, When the Falcon Boots up, does it suppose

A little yes.
>

not on a stock Falcon. My CT2 does. But that's because of the firmware.

I'm guessing you may have stiction on the old drive. Its a condition
where it doesn't get out of bed quickly enough for the system to
recognise it, tho it improves if the drive has already spun up. There is
a floppy you could create with a boot delay that gives the drive a
second or two longer to boot allowing the system time to detect it. I
can't remember what it was called tho.

Or Barry could just leave the 14 meg RAM board in, and not hit the space key to bypass the memory check at startup. See if that gives the older drive enough time to "spin up". Not really helpful, but might show if stiction really is the problem or not... :)

# 3291. TT Ram question

Newsgroup: comp.sys.atari.st
Date: 2008-06-07 08:07:46 UTC
From: Guillaume Tello <houten.van@wanadoo.fr>
Message-ID: <484a33f4$0$862$ba4acef3@news.orange.fr>
Source record: 3208

Hello,

I have two Atari TT Ram boards, one with 4Mb and the other with 16Mb.
I noticed that they share the same square IC C300869-001A. So I'm wondering
if the 4Mb one can be upgraded to a 16Mb by changing the SIMMs
(you can say: just do it and you'll know... but they are soldered! and it's
too long a work if the answer is NO).
The 4Mb has number CA400312 and only three jumpers W,W2,W3.

Guillaume.

# 3292. Mega Ste dip switches for hard disk controller and resistor pack

Newsgroup: comp.sys.atari.st
Date: 2008-06-07 16:10:21 UTC
From: Alyre Chiasson <alyrechiasson@yahoo.ca>
Message-ID: <484ab2ea$0$4056$9a566e8b@news.aliant.net>
Source record: 3210

Hello,

With the acquisition of a new floppy drive I decided to try and get my Mega Ste up and running. I was wondering what the jumper settings should be on the mother board connector for the Atari hard dish controller when the controller is removed? Are there any other dip switches on the mother board that must be flipped when the controller is removed?. I want to use my ICD Link II in its place. All of this was because I thought the controller might have been at the origin of some of my problems with getting the hard disk to work properly. However, when I opened the case a red resistor pack (at least that's what I am calling it) fell out. It has 8 pins with a shiny red housing that covers them across the top. There are other similar ones on the mother board. The questions is did it fall out of the mother board from somewhere or was it a leftover during fabrication? Are there any schematics of the Mega Ste that might tell me where it might have come from or where they should be? Google turned up some references but nothing concrete. It could be at the origin of all my problems. The last series of numbers on the resistor are 311J213.

Thanks

Alyre

One thing to note if this is a standard 3.5 inch drive (especially 7200 rpm). It may be necessary to remove a 1/4 of an inch or so from the ribbon cable just before the drive on pin #1. That would be the wire that has a red line down it. What does this do??? Most newer IDE drives do not like to wait for the signal from the falcon to boot. The Falcon just does not have as much BIOS crap to go through which makes it faster at starting the boot process. If the drive is not spun up first then the computer turned on then it wont boot. If the drive is hooked to an external power supply not used by the Falcon remove a small piece of wire from pin #1 and it will spin up and you can start the falcon normally without issue. This is the way I have to boot my CT60'ed Falcon and been doing it for 5+ years now with the same hard drive with NO issues.

Thanks,
Falcon060

Alan arvostuksesta kertoo varsin suoraan se miten alan ammattity�v�est�
suhtautuu tekemiseens�. Siit� voidaan ottaa esimerkkej� laajasti.
Ammattilaiset haluavat usein my�s j�lkikasvustaan ty�ns� jatkajia.
Yritysmaailma on pullollaan ty�st� ylpeit� is�lt� pojalle siirretty�
sukuosaamista. Mutta yksi ala loistaa poissaolollaan. Yksik��n ydinalan
ammattilainen ei kehu firmaansa julkisesti netiss�, lehdiss�, ei edes asiaa
kyselev�lle lapselleen. Jos katsomme ketk� julkisuudessa ydinlobbailevat,
niin yht��n alan ammattilaista ei taatusti n�y lehtiotsikoissa, netiss�
saati mualla. Vain rahalla ostettavia politikkoja ja vastaavia, jotka eiv�t
erota uraania hiilimustasta taatusti.

Rupesin todella ihmettelem��n miksi. Ja ennenkaikkea KETK� ovat maassamme
nyky��n ydinalan ammattilaisia? Heit� on maassamme tietysti tuhansittain,
mutta keit�? Heille on yhteinen piirre se, ettei n�ill� ole esim.
perustuslakiemme mukaista lakko-oikeutta, kell��n! Toinen keskeinen piirre
on niinik�� lainvastaiset ylipitk�t jopa 12h ty�vuorot ja loputtomat
ylity�jaksot vailla omaa p��t�nt�oikeutta. Kolmas ominaisuus on tekem�ns�
ty�n arkaluontoisuus, mik� tarkoittaa orjallista vaitiololupauspakotetta
uhkailu-ukaaseineen ydinjohdolta. Esim. OL-1,OL-2 ja OL-3 ty�mailla ei
KET��N saa menn� vapaasti jututtamaan tekemisist��n ja m��r�ys on ehdoton,
vaikka maamme pit�isi olla demokratia. Mik� kertoo my�s alan valonarkuudesta
ja h�m�ryydest� enemm�n kuin paljon.

Niinik�� ydinty�l�isten palkkataso on enmemm�n kuin romahtanut loistonsa
p�ivist�. Jos lasketaan Suomen ydinty�l�isten ansiotasot saadaan tyyty� jopa
7 euron tuntipalkkoihin! Reippaasti alle jopa siivoojaminimist� puhutaan
ydinalan ammattilaisistamme keskim��rin kautta maamme! Kun viel� 70-luvulla
ydinosaaja oli huippupalkkalainen ja arvostettu, on h�n t�n��n l�hinn�
kansan hyljeksim� reppupuolalainen, liettualaisorja, turkkilainen, yms.
joita katsotaan pitkin nen�nvartta, jopa kaupan kassalla, koska heit�
arvotetaan toki my�s olemattoman orjapalkkaostovopimansa mukaan
olemattomuuksiin. Ja tieto siit�, ett� suurin osa ei maksa edes veroja,

If you want to install rpm without a shell then have a look
for RPMtool by Marc-Anton Kehr.

You will still need to have a Mint filesystem though.

When I first upgraded my basic Mint install to use a Mint filesystem
I was put off by the rpm system but now I just try to ignore the
scary installation wizard aspect of letting something install stuff
for me.

Ian and Mark Baker have very kindly released the source code to their
Family Tree application.

The source can be found at www.atari-family-tree.org.uk
and look in the 'Source' folder.

If you prefer CVS then

export CVSROOT=:pserver:anonymous@cvs.atari-family-tree.org.uk:/var/lib/cvs
cvs login
(hit return, no password required)
cvs get famtree

I hope people can make good use of this.

Peter

I replaced my old EasyMint install with a complete new one last year
and had the same problem. The files in u:\opt\toswin2\ should have
the execute privilege. You can change it from Thing file Info.
```

This happens to me a lot when installing new software from a zip file
in ext2 partitions, i must set execute rights manually. I thought that
it happened because it was zipped in a NON ext2 partition and there
were no rights in the files, so they were set in my computer by
default with no execute attributes.

Mega STE schematic can DL here:

http://dev-docs.atariforge.org/

There you may find purposes of DIP Swithes (it's called so) in
machine.
I know only from memory that switch pos 7 is for activating high
density floppy mode - in case that you replaced your original one (for
instance EPSON SMD 380 was in mine, SD) with some HD floppy.

IIRC it only activates HD-mode in the desktop floppy formatter. HD-mode is
handled automatically.

Yes that's right. There was a auto folder program that used to assign
the correct cookie too. For those with HD and no MegaSTE;-)

Nothing specific for the LAN-ports AFAIK. They're just ordinary
serial-ports (RS-422 I think), so you can run TCP/IP over SLIP or PPP like
on the normal serial port.

I found the program on http://www.umich.edu/~archive/atari/Network/Local/
and I'l give it a go when I get home - at work atm. Do I need a
special cable for the lan port? (I can't remember its shape atm)

That's not correct. With switch 7 at original pos. my machine
couldn't read HD floppies. When I moved it, then it started to read
HD, and formatting in HD as option appeared too.
Of course that HD is handled automatically, otherwise it wouldnt read
DD floppies. Under activating I meant not momentaly mode, but support
for HD mode...

I've had 3 MegaSTE's and they all behaved the same. I could format
1.44's with the switch off, but not from the desktop menu. The switch
enables a cookie for TOS. It flags the drive basically. There is an auto
folder cookie app that simulates the same thing for non
MegaSTE/TT/Falcon owners.

What version of TOS were you using? I have only really tried with 2.06.
I had a 2.05 Mega but upgraded it before I even used it. Also installed
TOS 2.06 rom's in STE's and STFM's as well as a couple of HDD upgrades.
Always the same. Step rate was really the only issue.

Mark

I have found DUETLANT for the TT, I can't get it to run...

I have on both TT:
- DUETLANT.PRG
- then DUETCONF.PRG & DUETCON.INF in the auto folder

DUETCONF.INF has:
SPEED 19200 (not too ambitious)
TIMEOUT 5 (cool, no hurry)
STATE 0 (read only)

And one of them has this line:
DRIVE N F (locally virtual drive N will be connected to distant existing
drive F)

The boot is Ok, then when I try to reach drive N, 5 seconds after I get
a message saying that data may be corrupted on drive N. But it exists!

Guillaume.

That's where I got it!
I used the cable found between a MacIIsi and its printer. Is it the good
one? Don't know...

Well if you can make a network even with another serial port (I have a
Modem 1 connection) with Duet, I'd like to know your settings.
Does SERIAL.CPX interfere?
I tried with and without it, no change...

Guillaume.

My Mega STE behaved exactly like yours. It was a rather early MSTE with a
standard DD floppy. When the floppy died I replaced it with a Sony
HD-drive. It worked fine without touching the dip-switch at all.

I used Links to access my office webmail system today. I can't get
in with Highwire due to ssl and js.

It works but the layout is poor with some scetions missing.
It shows the list of emails but doesn't show the mail content.

I suspect that the lack of CSS support is the biggest problem.
Highwire has quite advanced CSS rendering.

As a user I have to ask which is easiest, adding CSS into Links or
adding JS and SSL into Highwire ?

Well, I checked it again yesterday... (I don't use much floppies on it, there is hard disk of course). It worked not at all with HD floppies. So, I replaced drive and it worked. Then I checked problematic floppy (TEAC) and saw that HD sensor is little moved, and diskette with HD hole still pushes it down. I bend it with small screwdriver, so it is now OK.
And yes, switch pos 7 is only for extra format option.
It looks that when I put in TEAC (about year ago) it just had similar HD detection problem, and after moving DIP switch 7 it just happened that HD sensor switch worked good...
I have TOS 2.06 . It is some early Mega STE, was 2.05 in, but I replaced it immediately.

Yeah, step rate is solved very primitive, and with DD floppies we have horrible sounds - especially TEAC has loud one.
I patched TOS 2.06 earlier, and set there steprates to 3 mS, used some little proggies or bootsector of floppies to set 6 mS for HD diks. It was for 520ST with added simple circuit for supporting HD floppies. Of course, it offered not HD format from Desktop, because was no port and microswitches.

Btw. I solved steprate problem in STE with special HW adapter - it switches back FDC clock to 8MHz while stepping - done with monostable. So, no SW fixing is required.

PP

Does your MSTE have a 1772-02-02 or an Ajax floppy controller? My had a
02-02 and HD did work fine. I'm just curious whether the Ajax solves the
step-rate-problem more elegantly than the 1772.

Hello,

Today, I tried DUET also, with 3 computers.

- between TT <-> MSTe 1
- between TT <-> MSTe 2
- between MSTe 2 <-> MSTe 1

Without success.
I used two different cables.

I disabled my normal AUTO folder, and booted the machine with minimum
requirement.
I got drive N (mapped to drive C on both machines), but couldn't open
the folder.

Mayby someone has more luck ?

In the near future, I'll try it again with sting, and bnet.

Kind regards,

Mark

It has Ajax. But that chip is nothing better considering steprate.
It is just guaranteed good for HD floppies and maybe for ED ones
(never saw such). In other words, it can reliabely work at 16 MHz or
even 32 MHz (for ED). But dumb FDC never knows with what MHz is
clocked, so steprate should be solved by OS. Atari could solve it with
little effort - just setting steprate according to what floppy is
inserted and/or at what clock FDC runs. Maybe it would require
additional bit on some port, don't know.

I've connected ethernec's to my falcons (2x) , and netusbee on my TT.
Under mint, I use mintnet and bnet for mint.
Under magic, I use sting and bnet for sting.
With bnet I've graphically access to the other computer. The other
computers are located on a 'p'-drive.
I can copy over the network, just by drag and drop, from one to
another window.
Bnet is for me a great piece of software. I like it a lot.
Unhappily, it don't work with samba drives.
For that I use Sharity-light (under mint, or under magic).
You must always use the command line for establishing a network
connection. Writing a startup script would be a good idea :)

Greetings everyone!

Here is the lucky winner for May 2008 at The DarkForce! BBS:

June 2008
1. ST Magazine - Doc Clu wins the free 3 mag. subscription

Congratulations to our winner!

---

Also, here are July's prizes:

July 2008
1. ST Magazine - some lucky Atari caller will win a free 3 magazine
subscription.

2. A complete TOS 2.06 ROM set for your ST, courtesy of Techie_Alison
(thanks Alison!)

Congratulations to our winner, and good luck to this months callers!

:)

Could someone kindly explain how to untar and compile this using plain
TOS? Although I understand the issues from my Linux days, I don't
have any Linux computers running right now, so instructions, or a
zipped binary would be most helpful.

Galen

Hi,

If you bought this MSTE new, it's strange that one of these would just
fall out.
The MSTE has these on the MB as you have already mentioned.
If you happen to have ST Format Issue 38, Sept. 1992, you will
find some color pics of the MSTE motherboard which may help
locate where this goes.
The MSTE HD Controller also has one or more of these IIRC.

BTW, are you sure this Red Resistor is 8 pins and not 9?

Also, it could have came from the internal Hard drive.
Not positive, but could be a termination resistor, if so, these
are sometimes soldered and sometimes fit into a small socket.

What kind of problems are/did you have with the internal hard drive?

I recently re-installed the stock HD in my MSTE, maybe I can
help you with yours if you need some.

Regarding Disk Drive STEP RATE,
I thought, that this was taken care of after STE TOS was introduced.
I've never really messed with the Step Rate on any Factory drives.
All my Falcons, MSTE, 1040STE have the same Step Rate set.
Even though the 1040STE has only a DD drive. Never had a known
problem from it. When attaching external DD Drives, the Step Rate
is the same as the internal DD Factory drive on my 1040STE.

Now when using my 5 1/4 Floppy Drive (made for use on an ST/E),
the step rate needs to be set different, if TOS doesn't do it automatically.
Can't recall if TOS set that drives Step Rate different Automatically or
not.

I don't use the TOS's built in Format/Copy function that much.
One of my Favorite replacements is FASTCOPY PRO, however the
version I have which is Original, doesn't work on the Falcon.
I think there was one more version better than my current one.
FastCopy Pro, has support for 5 1/4 drives, Step Rates and much more!

My MegaSTE has the Factory 1.44 Disk Drive, I recall using a external DD
drive with it, but don't think I ever had to mess with the STep Rate.

Also, To my knowledge, STE TOS supports 2.88MB drives.
I don't recall anyone trying such a drive in a MSTE/TT or Falcon.
Anyone?

Steprate is solved very 'elegant' in TOS 2.06 - it is set to fixed
6mS- So, good for HD, good for DD floppies. Not good for ears. For 5
1/4 drives 12 mS steprate is required - not problem, just need to set
some system variable, or use some prg. for that. I remember about it -
we connected some PC drive in time when PC Ditto arrived, some 20
years ago ? Of course, TOS sets not steprate automatically. I don't
know about Falcon and TT, but Mega STE with TOS 2.06 certainly sets
nothing automatically.

Actually, all TOS support 2.88 MB drives - TOS is very flexible
considering diverse disk formats. Some people reported succesful usage
of ED floppies. (and needed to set steprate to 12mS, likely) .

Btw. I just read on Atari forum that only dip switch 7 is used from
whole block. Others are unused in Mega STE.

From the time before I put a full ext2 Easymint distribuion on my Milan
I have a tar.ttp and version of gzip on a TOS partition that woul extract
this but I can do it with FreeMint now unless someone has beat me to it.

I'm pretty sure one can extract this kind of archives using plain TOS.
Look for gzip124b.zoo, gtarbin.zoo, sttar.arc, packshell. These utils can
be found on almost every Atari ftp-server

# 3337. FS: ATARI 800XL working (?) incl videocable, monitor is extra for shipping, also cartridge (nonworking?, Citibank unknown applications)

Newsgroup: comp.sys.atari.st
Date: 2008-06-16 00:02:54 UTC
From: Mark Licetti <MetalBladeNOJUNK@NOJUNKprodigy.net>
Message-ID: <wWg5k.8304$jI5.289@flpi148.ffdc.sbc.com>
Source record: 3055

I have Atari 800XL system, main, CPU or "console" unit - whatever it was called (I am not an expert on vintage computers/games). Owner claims it WORKS FINE, but since Chess Game memory cartridge failed they never used it, chess was the only thing they cared for. There's another cartridge from Citibank and I dont know wha tit does, I am quite sure main unit works. Video cable is included, even monitor is available but I doubt anyone wants a small CRT whitish monitor these days, it's probbaly better to hook up to a modern monitor thru some sort of connector adapter. I have connectorized videocable for it.

Main unit looks like a keyboard integrated with CPU/mainboard, it's clean and owner says it works. Any interest?

Do NOT reply on Newsgroup, email instead and REMOVE "NOJUNK" strings in my address.

Best if transaction is conducted on Ebay 9for safety) - my Ebay feedback is 100% positive, not to mention a DECADE of Newsgroups trading without any complains.

Is it a spam? I not see any relation with Atari computing.
We often see discussion change with time but directly have no relation
at all this is not so usual.

Plain TOS with standard filesystem does not support a filename like
mypdf.tar.gz to start with. Renaming to mypdf.tgz first should not be a
problem even on a Windows machine. I have not looked inside the archive
yet if it uses long(er) filenames.

The Atari link would be that the Alone in the Dark series is/was produced by
Infograms, the company that has been trading under the Atari name for the
last few years.

Cool, Didier!

> Now Links displays background images.
> More informations here:http://links2.atari.org

It sort of saved my life. I was sans PC/Mac for a while and needed a
way to access my Gmail account (to have some degree of contact with
the outside world besides IRC & ICQ).

It actually works (bit tricky though):
- go to http://gmail.com/app
- select log on via browser
- enter your login info
- reject the javascript
- a weird link appears in the upper part of the page. Click it.
- Another weird link appears in the upper part of the page. Click it.

TA-DA! There you have it!

I have done this under Magic with some success. I just run gzip first to get
the tar file and then use Arcview.

Hello,

Here's what I've found:

http://pagesperso-orange.fr/gtello/new.htm

The inside is dirt, no metal cover. I'll have to clean it before switching
it on to test the computer.
The mother has little modifications: 3 resistors cut and a strap.

Guillaume.

Source record: 3067

Hi again:

SYSINFO83 tells me:
- bank0 : 512 kb
- bank1 : 2048 kb

But it is a 1040 with full ram on the mother board, so I expected bank0:
1024kb, am I right?

And the expansion board says 4MB exp ram, so, why only 2048?

Is there a software driver with this board to configure correctly the RAM?

Guillaume.

>
> Regarding Disk Drive STEP RATE,

Steprate is solved very 'elegant' in TOS 2.06 - it is set to fixed
6mS- So, good for HD, good for DD floppies. Not good for ears. For 5
1/4 drives 12 mS steprate is required - not problem, just need to set
some system variable, or use some prg. for that. I remember about it -
we connected some PC drive in time when PC Ditto arrived, some 20
years ago ? Of course, TOS sets not steprate automatically. I don't
know about Falcon and TT, but Mega STE with TOS 2.06 certainly sets
nothing automatically.

Actually, all TOS support 2.88 MB drives - TOS is very flexible
considering diverse disk formats. Some people reported succesful usage
of ED floppies. (and needed to set steprate to 12mS, likely) .

Btw. I just read on Atari forum that only dip switch 7 is used from
whole block. Others are unused in Mega STE.

PP

Hmmm...6mS standard Step Rate???
Not on my Ataris...
All are 3ms, even the Falcons.
I have never used 12ms.
But have used 6mS for 5 1/4 drives.

If you could *write* *here* what is written on the RAM chips we could
possibly tell you if this is the case.

Don't know if anyone is looking for this, but I've got Cubase 3.1 with dongle and manual on eBay.

I can also ship without the manual, which will make it a lot cheaper to ship.

Details here:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=170231714139

Thanks for reading.

There is 512k per bank. 1040 and 520 is Bank0 512k, 1040 is Bank1 512k.
So 2.5MB is correct.

I had a Marpet board that used a similar PCB. You might have to track
down the instructions to see if the second bank is usable. It is also
possible that it is only a 2mb board. It may be that the designers just
used a single PCB for 2/4mb ram.

Mark

```
Hello,

So what I'll call the IC controler (40 pins) is labelled:
C025914-38A
PH23-024
7M2-10

And each of the 4 RAM chips (20 pins):
M5M44400AL
115SD50-8

That's it!

Guillaume.
```

I did not say that 6mS is standard step rate. It is just how is set in TOS 2.06 to avoid bad work with HD floppies. Problem is that by DD floppies it produces nasty sound.
What Ataris? I didn't talk about Falcon, what btw, works not with TOS 2.06.
Will some 5 1/4' drive work with 6mS steprate depends on it's mechanic. What I tried somewhere in 1988 worked only with 12mS well.

# 3364. Free Atari ST Software (almost)

Newsgroup: comp.sys.atari.st
Date: 2008-06-24 00:50:39 UTC
From: "J. A." <last_atarian@yahoo.com>
Message-ID: <1d-dnVcw7OkH2f3VnZ2dnUVZ_sbinZ2d@earthlink.com>
Source record: 3082

Hello all.

I'm cleaning house and getting rid of some old software for the ST. I want them to go to a good home but I really don't want to piece it out so if anyone is interested, you gotta take it all. All I ask is to pay actual shipping costs via Google checkout. The titles are as follows:

Games:
Amazon
TerrorPods
Batman the Caped Crusader
AB Zoo (educational)
Crack Down
Dick Tracy
Road Blasters
Road Warrior 2000

Development:
GFA 2.0 + compiler
DevPac ST 2
DevPac 3

Other:
Hippo Disk Utilities

If interested please send an email to :
last_atarian(at)yahoo(dot)com

and we'll make arrangements.

Thanks!

# 3366. ACARD scsi-ide bridge cards

Newsgroup: comp.sys.atari.st
Date: 2008-06-29 13:32:46 UTC
From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <g482tu$4cr$1@reader2.panix.com>
Source record: 3084

My it's quiet in here.

I had a Lite-On CD and whatever reader-writer box in a Syqyest 44 case, which worked for a while, and then halted booting. Thought it was a bus problem.

Thought I had solved most bus problems, so tried again, by changing ACARD cards. A version 3.79 came out, a version 3.64 went in, and all is well again. I do not think it is a version problem, but a dead card. It prevented proper booting with the card connected to the scsi bus but not to the IDE drive. That should be a major clue to a dead ACARD problem.

Do not give up yet.

Jim

# 3367. NAS2008 is finished - photos, results & releases

Newsgroup: comp.sys.atari.st
Date: 2008-06-30 18:43:28 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <12ec0a4c-0635-4c8a-984f-f2bb3e5dbb02@l42g2000hsc.googlegroups.com>
Source record: 3085

Hi all,

Yet another NAS has passed and all of us who attended had a great time. This year we had 8 player games going, Jaguar gaming, a Coldfire experiement board booting up a patched TOS, standard ST, MegaSTe and Falcons as well as accelerated models, and more.

PHOTOS:

Photo gallery with pics by GokMasE from NAS2008 can be viewed here:
http://www.ataricq.org/pictures/2008-06-27/thumb.html

This years event was a pretty productive one, with some software and stuff being finished:

GFX:

Bear used a Tabby on his Falcon to produce a nice piece of gfx for NAS2008:
http://www.sak.nu/cutenews/data/upimages/NAS08.png

GAMES:

PeP released preview of "PeNES", his experimental NES emulator for 060-equipped machines. It's based on a heavily modified version of NESCore, a nice open source NES emulation library. PeP says: "Don't ask me where to find NES ROMs etc. I have no idea."

kRadD released his new multiplayer game for 8 players, Grenzüberschreitung.
http://www.npoi.de/download.php?view.4

GAMING:

kRadD arranged a STOT competition for Kick Off 2, Speedball 2 and Grenzüberschreitung v1.0.
http://www.npoi.de/e107_plugins/content/content.php?content.32
http://www.npoi.de/e107_plugins/content/content.php?content.33
http://www.npoi.de/e107_plugins/content/content.php?content.34

DEMO:

STOS Bestens karma - the one and only demo that was made at NAS! A beta version of the demo was shown, and it contained music-synchronized text. The music was made by J in Triplex and the STOS-code was made by Kl0tt. An official version will be released later.

OTHER:

AtarICQ goes freeware. The most noticeable change with the AtarICQ 0.173 release is indeed in the change of the program license - it has now become freeware. The application is by no means discontinued, the change just reflects the fact that the program now no longer has any restrictions or naggings. In fact, the registration process has been completely removed. Some other small tweaks and fixes were also added, like for example the new feature that aICQ will now recall which TABs were open during the last session.
http://www.ataricq.org/ataricq/

Litchi-patches. Since Rajah was kind enough to supply GFA sources, GokMasE took the opportunity to tweak some stuff in the prog, most noticebly the possibility to drag files from the remote window to desktop directory windows was added.
http://topp.atari-users.net/litchgok1.zip (needs original archive at http://rajah.atari.org)

Thanks all who attended and made this years event a nice weekend! :)
See you all next year.

Regards,

/Joakim

And more XaAES (+ MyAES ?) friendly, as i saw the patches in the LST source.
Very nice work, thanks you.

Remarks:
- the text for FORM_ALERT is located is the RSC, for translation purposes.
- desktop windows to Litchi remote window Drag&Drop is possible, if the
desktop supports the Atari Drag&Drop. Magxdesk and multiTOS desk do.

The Drag&Drop from Litchi remote window to desktop windows is also
possible, but i have found no desktop using the Drag&Drop "PATH" method.
But you have implemented it via the AV_Protocol...

Since the schmilblick goes forward, i should be happy. Though feeling a
little suprised having not been asked an authorization for some
modifications; i suppose you decided to patch the Litchi to kill a bit
of time in the NAS party.

And feeling also a bit "deprecated" myself. And i do not know what to do
with Litchi developpment now. Include your patches in the official
release? Add some improvements to justity a new update? i have no idea
of new funtions, and nobody mailed some suggestions since a long time.

Best regards

Pierre

There were problems with WM_ARROWED and WM_BOTTEMED, nothing serious,
but should work a tad better with at least XaAES now :)

> The Drag&Drop from Litchi remote window to desktop windows is also
> possible, but i have found no desktop using the Drag&Drop "PATH" method.
> But you have implemented it via the AV_Protocol...

Yes, AV-Protocol seems like a solution that ought to work with the
more recent
desktops such as Jinnee and Thing.

> Since the schmilblick goes forward, i should be happy. Though feeling a

Indeed, these were some ideas I had, and NAS seemed a nice opportunity
to
test them a bit.

> And feeling also a bit "deprecated" myself. And i do not know what to do

Feel free to use the patches any way you please. If more ideas comes
to mind,
I will of course submit them to you. Thanks again for supplying the
sources,
allowing others to pitch in and help out with the program.

Regards,

/Joakim

Okay, thank you very much. I will include your patches in the next
official release, keeping yours comments and adding your name/nickname
in the credits in the program info window.

I'll think of some new features, to justify a new release, and verify
under MagiC.

Best regards

Pierre

Lee,
I have an Mega ST2 which sadly only produces green video. I keep meaning to get it fixed, but every time I plan a drive across to Barry at Keychange something crops up. I used to have a "BBDP" hard drive adaptor and their own software. These days I use HD Driver, but to be honest I don't really have time to fiddle with my Ataries :-(

# 3378. On summing "bytes used" when showing folder info

Newsgroup: comp.sys.atari.st
Date: 2008-07-06 11:11:50 UTC
From: vdjole@EUnet.yu
Message-ID: <g4q99j$j8l$1@news.eunet.yu>
Source record: 3096

Hi;

When displaying the contents of a directory, or information
about a selection of files to be e.g. copied (in a desktop program
or in a file copy program), it is usual to display the total count
of "bytes used" in the selection. This number is (almost always?)
obtained by summing the "useful" bytes of all relevant files, which
can results in numbers of a magnitude of several billions that appear
to be accurate down to the last byte.

It might be argued that this is not always the best approach,
because each file actually occupies an integer number of clusters
on the disk, and a cluster can have a size of several kilobytes.
The count of used clusters, multiplied by cluster size in KB, may
actually give a more meaningful and easier-readable information about
the really occupied space on the disk. It would be a more accurate
measure of the effort required to perform a copy (or other similar)
opeation and enable easier estimate of wheter free space on the target
location is sufficient. Beside that, it would in a simple way avoid
the problem of overflowing the 2 GB or 4 GB limit for total byte count
that appears when using simple 32-bit integer arithmetic.

On the down side, this approach would be contrary to the "tradition"
originating from MS-DOS (or CP/M ?) o displaying the sum of "useful"
bytes.

It may be noted that, on large disk volumes with large cluster sizes
the difference between summation of "useful" bytes and calculation
based on summation of used clusters can be significant.

The proposition therefore is that, when a desktop program displays
information about "bytes used" in a directory or "bytes to be copied",
the used clusters are to be counted and summary information is expressed
in kilobytes (except in very rare cases, cluster sizes appear always to
be at least 1KB). Individual file sizes would still be displayed as
"useful byte" counts.

Any opinions?

cu;

Source record: 3098

Mega STe, TT030, Stacy needing new hard drive, and an ST or so, including one with a memory upgrade by JRI (John Russel Industries) personally, and more than one Portfolio.

My problem has been finding drives that do not drag down the machine bus, and make unpredictable things not work. When 4 gig drives were first made, 4 out of 12 worked on any Unix system, including Atari MiNT.

What I have found are marginal. I have bought many, through E-Bay, and scrapped most of them. The ones I kept HDDriver recognizes, formats, but will not partition, since some of the full command set do not work on these drives. So, I use ICD Pro Tools to format and partition, and if for more than four partitions, I add two partitions not enabled, and the fact that the last two partitions are not recognized when one boots into HDDriver has no effect.

This is from a TT030, running MiNT, with an internal 4-gig drive partitioned to C-J with ICD Pro Tools, with two extra not-enabled partitions, (K and L) and a 4-gig external drive partitioned to K and L as LNX partitions with ICD Pro Tools, and all of this boots and runs under HDDriver.

My SCSI bus at the moment has that external MiNT drive, and the newest Phillips IDE DVD and whatever drive on a icd to scsi bridge card.

This is all at the cost of about thirty scsi 4-gig hard drives, which hit the trash, all to get me back to where I was years ago, with all bus slots filled with something useful.

Mega Ste has a 2-gig drive. I do not remember the details, but DISCUS tells me that ICD Pro Tools once partitioned it. It boots from HDDriver 8.20.

Hi;

I have an opinion, and it seems to match. My partitions are 525 meg, so my cluster size is something bigger than 1024 bytes. So, if calculating bytes used or space used, I need probably 16K clusters.

On the other hand, I move what files will move by Kobold by Kobold, and that moves files by actual bytes, to another partition of 16K clusters.

Anyway, the tradition from MS-DOS (which was CP/M with a relocating loader) no longer is relevant.

I like your idea.

From: Guillaume Tello <houten.van@wanadoo.fr>
Message-ID: <48713e12$0$876$ba4acef3@news.orange.fr>
Source record: 3100

I wrote long ago an article about this problem in the french ST
Magazine.
I used the following formula:

(bytes used) + (number of files)*(cluster size)/2 + (number of
folders)*(cluster size)

Estimating that the mean error on each file can be cluster/2. This gives
a good approximation of the real used size.

For example, to copy 200 files and 15 folders with a total of 1.000.000
bytes on a partition with cluster size = 4Kb:

1.000.000 + 200*4096/2 + 15*4096 = 1.471.040 bytes.

But that's not exact!

The article can be found at:
http://pagesperso-orange.fr/gtello/downld_f.htm

In the first list, download the file named FICHIERS (13Kb), but the
article is in french...!

Guillaume.

> Any opinions?

I don't like this very much, because the size of the FILES is not the same
as the space they occupy on a certain partition or filesystem. Your
proposition means that the exact same selection of files will be displayed
with different size on different partitions - not very logical to me.

Also, if you attempt to copy 10000 files with a total size of 97Mb from a
partition with 16kb clusters to a partition with 1Kb clusters and 100Mb
free, you're not allowed to do this because your way of calculating the
size of the files on the 16kb-cluster partition indicates a total size of
105Mb...

Hello,

How to set, by software (not using a CPX) the serial speed of the TT/MSTE
ports to a speed greater than 19200?
For example, I'd like to communicate at 115200 bauds, how can I do it?

Guillaume.

I agree with Jo. There will be ptoblems when copying to partition
with different cluster size, even on floppy from HD...

Probably is best to give both sum - of filelengths and occupied spaces
on partition.

Well, I've got a Mega ST2, upgraded to 4 megs of RAM, ADSpeed accelerator
(16mhz), TOS v1.04, 4 gig hard drive, with a SCSI CD-Writer, in an
external box. I use it to run DarkForce (my BBS). :)

Rsconf() XBIOS function only supports up to 19200 bauds.

As far as I remember, most high speed serial TSR (like HSmodem) replace
the slower speeds (50,75) with high speed ones (115200,230400). But I
don't know if you can query the new/real baud rate.

If you really want to set high speed on a serial port, you'll have to
resort to call Fcntl() on a serial port device (HSModem provides it
for TOS, you have it by default under MiNT).

Hi,

According to the Atari Compendium,
http://www.fortunecity.com/skyscraper/apple/308/html/chap4.htm#serial,
"Rsconf() and Iorec() set the communication mode and input/output
buffers of the currently mapped serial port. You should note that
while some ports support transfer rates of greater than 19200 baud,
this is the limit of the Rsconf() call. Other rates must currently be
set in hardware (or with the Fcntl() when MiNT is present)."

Unfortunately how it should be set in hardware is not clear. I guess
next ide would be taking a look at the mint sources to find any clues.

Regards,
George

Thanks, that's the one I have too.

Anyone knows how to print automatically the page number in Atari Works?
For example, I'd like to get at the bottom of every page:
Introduction, page n#

Guillaume.

"Possibly."

I regret I do not now have an Atari to try it out and I'm reluctant to say
it can unless I have tested it.

Anyone else here know?

The fact is that I have a very long document created with AW. And
translating it to another soft would be a long job!
Unless Protext loads directly AW files?...

Guillaume.

Thanks a lot!

I could get it to run under Multitos, but not plain TOS. And again the
french RSC files were not accepted.

Guillaume.

>with different size on different partitions - not very logical to me.

But, in fact, a certain selection of files -will- occupy different
amount of space on different partitions, so the information I propose
to present may not appear logical at first sight but would be true.

I would like to mention dat when used space on disk is calculated
from information supplied by Dfree() the result is based on the
number of used clusters and can differ significantly from the sum
of "useful" bytes in all files. This, too, may appear ilogical and,
in fact, some users of TeraDesk have reported it as an error.

>Also, if you attempt to copy 10000 files with a total size of 97Mb from a
>partition with 16kb clusters to a partition with 1Kb clusters and 100Mb
>free, you're not allowed to do this because your way of calculating the
>size of the files on the 16kb-cluster partition indicates a total size of
>105Mb...

A good point. I did not intent to forbid copying anyway, just to issue
a warning- but it seems that the warning would be pointless.

>with different cluster size, even on floppy from HD...

He had a point here and I accept his argument. As I said, I did not intend
to forbid copying but only to issue a warning, but there is no use in
making that warning because very often it would not be appropriate.

>Probably is best to give both sum - of filelengths and occupied spaces
>on partition.

But the problem appared in the first place because, with increasing
partition sizes, it becomes difficult to give a sum of filelengths.
When a folder (or a partition) content is more than 4 GB one would
have to resort to the extravaganza of 48-bit (or 64-bit?) arithmetics.
When doing calculation based on cluster count the problem would
be deferred at least to capacities of several TB.

48-bit, or 64-bit atithmetic can be done with 68000. Little slower,
of course.
Maybe wiser is to start rounding by so large partitions - no much
sense to give exact sum in bytes.

I can imagine (actually I experienced it) how long takes Desktop
partition info of some large part. with many files on Atari ST. It may
take several minutes...

Ok, so I found LINKS and downloaded it, and unpacked it. It appears that it is useless to me. It cannot cannot handle a color depth of one. Is there a workaround for my problem?

This from a TT030 with a TTM 195 monitor. That is about 96.1 dpi, and a color depth of one. I can get 34 dpi in color, but I have one of those at work.

# 3407. [ANN] Litchi 1.1C (bugfixes and small update)

Newsgroup: comp.sys.atari.st
Date: 2008-07-13 17:17:21 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <487a38a1$0$21146$7a628cd7@news.club-internet.fr>
Source record: 3125

Bonsoir

Download on my homepage or directly from the folder
http://rajah.atari.org/files/ -> litchi11c_uk.fr (110KB)

New for this FTP client (STinG/STiK2/GlueSTiK):

+ GokMasE's patches (fixes under XaAES environment and AV enhancements)
- Using the correct app name when signing up with AV_PROTOKOLL
(Using "LITCHI " instead of "TROLL ")
+ Dragging files from from REMOTE window to desktop window should work.
(Involves improved AV-PROTOCOL support)
+ Refreshing the desktops directory window after downloading (AV_PATHUPDATE)
- Sending Litchi's windows to bottom of window stack should work OK on all
AES' now.
+ The application name is now correctly reported through MENU_REGISTER now.
- WM_ARROWED problem under (at least) XaAES has been fixed now.
+ Added check if URL file was written OK to disk, else show an ALERT.
- bugfixes:
- in the URLs window, alerts corresponds now this the blank text field.
- also no more need to indicate username/password if anonymous access.
+ informations on a distant folder: numbers are more reliable. Scan is done in
the remote folder to set correct number of files+subfolders and length of
datas.

"Merci" to Joakim Hï¿½berg and Lars Schmidbauer

Voilï¿½

# 3409. Additional Modules for Cubase (CUETRAX, STYLETRAX, STUDIO)

Newsgroup: comp.sys.atari.st
Date: 2008-07-14 12:20:05 UTC
From: Jean Pat <jeanpatataribatvoila.fr>
Message-ID: <487b447a$0$17009$426a74cc@news.free.fr>
Source record: 3127

Monday, July 14th 2008,

the long awaited cracked additional modules for Cubase sequencer are now out! All disk protections have been removed!

- Studio Module : The Total Recall Studio Organizer. Manages the settings for all your synthesizers and other MIDI Devices.
- StyleTrax : The Accompaniment Tool. Make music in seconds with the Styles that are included, or create your own in minutes.
- CueTrax : The Graphic MasterTrack Editor. An essential tool for anyone making music for film or video.

These modules are compatible with Atari versions of:
- Cubase Score
- Cubase Audio (CAFCRACK packages included)
- Later versions of Cubase 3.x (For example, 3.01 is excluded contrary to 3.10)

I advise to put STUDIO.MOD, CUETRAX.MOD and STYLTRAX.MOD files in MODULES folder. Before loading Studio Module, you MUST create a STUDIO.DAT folder in current Cubase program folder.

Studio Module (v1.02 package):
http://jeanpatatari.site.voila.fr/modules.add/STUDIOJP.ZIP

Studio Modules (v1.06a, v1.06c, v1.07a):
http://jeanpatatari.site.voila.fr/modules.add/STUDADJP.ZIP

Studio Module driver editor:
http://jeanpatatari.site.voila.fr/modules.add/DMAKER.ZIP

CueTrax Module:
http://jeanpatatari.site.voila.fr/modules.add/CUETRXJP.ZIP

StyleTrax Module:
http://jeanpatatari.site.voila.fr/modules.add/STYLTXJP.ZIP

Special thanks to JLC!

Jean Pat

Always available CAFCRACK v1 (M) Crack For Cubase Audio Falcon 2.06:
http://jeanpatatari.site.voila.fr/cafcrack/v1/CAFCRACK.ZIP
http://jeanpatatari.site.voila.fr/cafcrack/v1/CAF206JM.ZIP

I don't agree. I'm not interested in the pecularities of the filesystem, I
want to know the size of the files. When manipulating/copying/moving files
around, there are two things of interest:

1. The size of the files themselves.
2. The amount of available space on the destination drive/partition.

You can sum the numbers of full clusters used in one 32 bit integer, and
the remainder in another 32 bit integer. Unless you have an awful amount
of very small (i.e. smaller than the size of a cluster) files this should
work with very large collections of files.

But much depends from file count too - lot of short files will
occupy much more space on target. So, for exact prediction before
starting copy you need to know cluster size of target, and size of
each file to copy.

Then, information about how much space is allocated on drive by files,
directories may be useful too. Not by copying exactly, but in
partition Info certainly. Win XP gives both info: sums and allocated
space.

# 3423. Running on an iPhone

Newsgroup: comp.sys.atari.st
Date: 2008-07-19 21:02:05 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <4882564d$0$952$ba4acef3@news.orange.fr>
Source record: 3141

Hi,

I just bought an Apple 3G iPhone, and was wondering whether someone
would be interested to port ARAnyM on this small computer hosted with
a sort of Mac OS X, and having the power of a machine from year 2000.

There's an open SDK available for it, and I'm not measuring the effort
at the moment. So if you have some experience with this kind of embedded
developments please give ones opinion, you're welcome.

ARAnyM already runs on my Linux Vaio laptop, on my 1.25GHz G4 MDD and on
my PlayStation 3 (Linux). The point is iPhone has a tactile interface.

ATARIstically yours =)

Regards,

Personnally Ihave some ideas for use another embbedded proccessor
(Freescale MPC5121e):

http://www.mtcera.com/product/img/05.jpg

there are more Mips by Mhz (Debian Linux).

Good luck!

How strange ! It would be the first time a big-endian configuration
embedding a Coldfire processor would be so called a "Personal Computer".

The 3G iPhone is powered with an ARM processor, and the hosted OS is
a Berkeley Software Distribution Unix, am I wrong ?

Big-endian Unices are coming back again, for everyday life customers.

That's really interesting, indeed.

ATARIstically yours =)

Hum.. before Feescale...
MCF was Motorola ColdFire.
MPC was Motorola PowerPC.

The fastest coldfire is always the v4e at 266 MHz (PFU & MMU), 3 or 4
years old now.
Here it's not a fastest PPC, it's an e300 core clocked at 400 MHz, but
it's an SOC (System On Chip) for reduce chips on the motherboard. It's a
tri-core because there are also on the chip an ALE (32 bits core for
audio), and a 3D graphics engine. On the chip because it's a
microcontroller there are also (like the colfire) CAN, ethernet, PSC
(programmable serial controllers), USB, SDRAM DDR controller, DMA, PCI.
But here also on the chip PATA, SATA, S/PDIF, DIU (display interface
unit), etc.. A total of 516 pins on the chip.

Regards,

Didier.

iPhone (3G and first 2G version are same) run iPhone OS which is
cutdown version od Mac OS X. So probably Hatari could be ported to
iPhone o:)

beside iPhone has ARM11 CPU downlocked to ~417MHz from 670MHz, it also
has PowerVR 3D chip, support core animation in Mac OS X....

so is it possible to make e.g. Hatari to run on iPhone??

I was making a confusion between those two kind of CPU references.

So, Freescale is designing PowerPCs, while IBM rather promote Cells.

That's interesting. So you're interested in PPC CPUs though Apple
switched to Intel, and no major informatics companies are still now ?

May we wish one day ATARI will propose their own hardware again ;-)

Best regards,

# 3437. I received an Ethernec

Newsgroup: comp.sys.atari.st
Date: 2008-08-04 12:56:54 UTC
From: Guillaume Tello <houten.van@wanadoo.fr>
Message-ID: <4896ee66$0$866$ba4acef3@news.orange.fr>
Source record: 3005

Hello,

I need some help to setup an Ethernec Card:

http://pagesperso-orange.fr/gtello/ethernec.jpg

Can you, looking at the picture, tell me:
- what is the good orientation to plug it into the rom port? (A or B?)
- what is the correct orientation of the ISA card? (C or D?)

What kind of Ethernet card can be used? I have:
- an Etherlink III (3Com)
- a common ethernet with chip APX EDI 95C02

What cable must be used for a computer to computer link? (no computer to modem).

Thanks!

Guillaume.

D looks right, could I cant 100% say as I've not seen this version
before.

> What kind of Ethernet card can be used? I have:
> - an Etherlink III (3Com)

Use Realtek RTL8019AS and if it is jumperless, use a PC to set it up
to port 0x300.

> What cable must be used for a computer to computer link? (no computer to

Crossover network cable.

## 3440. How can I tell if a TT030 is 16 or 32Mhz?

Newsgroup: comp.sys.atari.st

From: danielaqua@gmail.com
Message-ID: <8dd95455-aa88-4d67-8d14-b145ac574dca@m3g2000hsc.googlegroups.com>
Source record: 3008

I've been reading that Atari manufactures two Atari TT Models. The early 16Mhz models and the later 32mhz editions. How can one tell the CPU speed of the TT they are running? Also, did the later TT's have the 1.44 MB drives or the 720KB? Thanks.

You can use a program like sysinfo to check out the cpu frequency I
guess.

Only CPU is 32 MHz on some late machines... the bus is 16 MHz on all TT.
And the ST-RAM & TT-RAM accesses are 16 MHz....on all machines....
I just heart at the moment that the last rev of the mb (rev. H) are 20%
faster....but I never get the info WHY.

TT was a bad machine in 1990, surely a good in 1988.

Message-ID: <489b1b2e$0$6108$426a74cc@news.free.fr>
Source record: 3015

The first MSTE & TT were with 720 KB units because of the TOS 2.01 and 3.01 that was not able to manage 1.44.
With TOS 2.05/2.06 & 3.05/3.06 (for TT), the floppy is ok with 1.44. But sure you need a 1.44 unit AND to put ON the 6 th dip switch under the HDD place on the mb.

PS : The first MSTE mb have a hardware bug with a missing trace on the PCB AND a bug in the UA02 GAL.

"Staycation"? I love it.

I don't think Bravo Sierra Computers gets enough recognition for some
of the best Atari marketing continuing in the tradition of the classic
Atari commercials.

I ran Sysinfo on my TT and it always saus "32 MHz" even with my
CaTTamaran 48 MHz...

You can use Speedo Meter and you should have a value of 550% (with cache
ON). I can send you this little tool.

Guillaume.

Sorry for taking so long to reply to this, I thought I had replied earlier.

When it tries to load the tbl file it shows a -26 error.

Peter

> documentation for Interface?

No, I have only two mesaages:
$4f4d 20301 M_ASKVAR Interface
$4f4e 20302 M_SENDVAR Interface

But I don't know where I found them. :-(

> author but all attempts to mail him bounce.

The address in the printed manual is old. I ask Michael Bernau, author from the
MyDials, if he have more information.

I have the Multiface ST but not the cable that connects to the monitor port.
Does any one know what pins the Multiface connects to on the ST monitor
port?

# 3454. [ANN] KK Commander 1.1 (upgrade)

Newsgroup: comp.sys.atari.st

Bonsoir

Download on my homepage or directly in the folder:
http://rajah.atari.org/files/ -> kkcmd11_uk.zip (~50KB)

New features:
- disk list (with icons, up in the partition root or use Alt+F1/F2)
- font size can be choosen (of none selected, then default size)
- some changes in the key shortcuts (taken from similar programs,
careful, the GEM shortcuts prevail. See text file)

Merci Didier, Dma-Sc et Arklif

Voilï¿½

Gerhard Stoll <Gerhard Stoll @ B> worte:

> I ask Michael Bernau, author from the MyDials, if he have more
> information.

He have no more infos, but I found an old manual from 1992.

In short form:

A program send M_ASKVAR to Interface, this answer with M_SENDVAR. In the bytes
8-11 is a pointer to struktur with many functions.

```
LOCAL VOID *funcptr[] =
{
0L,
&rsd_namen,
&sel_window,
&sel_objs,
search_window,
find_window,
find_top,
is_top,
.
.
.
normkey,
find_rsc,
};
```

The functions a from the book "Vom Anfï¿½nger zum GEM-Profi" [1]

In the bytes 12-15 is a pointer to Interface variables.

Do you need more?

Gerhard

[1] Phoenix use also this library.

# 3460. Atari stuff to give away

Newsgroup: comp.sys.atari.st
Date: 2008-08-14 19:29:00 UTC
From: Peter_Schneider@b.maus.de
Message-ID: <200808142129.a55787@b.maus.de>
Source record: 3032

Hi,

a friend of mine is to leave the Atari world totally. So he will offer
all of his stuff to anyone interested.

At least 10 b/w monitors SM 124, more than 4 1040STF, about the same
quantity of MEGA ST4, some hard disks some removable disks with
cartridges, of course, and and and...

If interested, send an email to *m.hosry@t-online.de* and be prepared
to get to Berlin or Stuttgart.

Und TTschï¿½
ps

## 3461. TeraDesk 3.97 released

Newsgroup: comp.sys.atari.st
Date: 2008-08-15 09:25:48 UTC
From: vdjole@EUnet.yu
Message-ID: <g83i2r$hmo$1@news.eunet.yu>
Source record: 3028

Version 3.97 of TeraDesk open-source desktop for the 16-bit and 32-bit lines of Atari computers is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This release brings fixes to some not-very-critical problems that have been detected, and also a couple of small cosmetic improvements. Work on some other fixes and improvements is in progress. See the development history file for details.

Have fun.

# 3462. The DarkForce! BBS winners/prizes for July/August

# 3464. A request from DarkForce...

Newsgroup: comp.sys.atari.st
Date: 2008-08-15 20:33:31 UTC
From: "Ronald J. Hall" <darklord@suddenlink.net>
Message-ID: <pan.2008.08.15.20.33.31.462379@suddenlink.net>
Source record: 3031

Folks, I've been unable to deliver last months prize, despite repeated attempts. The user "Cedric" posted an invalid address to his account.

Now I understand everyone's need for privacy these days, and it doesn't bother me a bit if a user starts an account with bogus information, like their age, phone number, birthday, etc, etc...

BUT...if you're expecting to win *and* receive a prize from us, then the least you can do is have an accurate address. I have a full time job, 84 hours every 2 weeks/12 hour nightshifts, plus a family of 5 and honestly, I don't have the time to chase everyone down. I've left e-mail with Cedric on the BBS and I hope he gets and returns it. Until then, there's nothing else I can do.

Just for the record - DarkForce has never lost any user information, due to being hacked, nor have we ever give out information to a third party.

Nor shall we ever.

Thanks to all our dedicated users and the Atari community.

# 3467. Pixart and MagiC

Newsgroup: comp.sys.atari.st
Date: 2008-08-17 16:59:40 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <2fSdnSxMr7FhxTXVnZ2dnUVZ8sjinZ2d@pipex.net>
Source record: 3035

I am having problems running Pixart 4 under MagiC 6.01 on my 14MB Nemesised Falcon. It loads OK, but trying to use any of the tools fails - I can't draw, or drag out a box for cutting etc. at all. Without MagiC (but leaving NVDI running) all is OK.

Anyone else have this problem? And found a solution? (other than booting without MagiC, which is what I do when I need to use Pixart)

Regards, /Peter/

Source record: 3037

Hello

Has anyone got Lichti running to a shell host, such as shell.panix.com,
yet?

It tries to log in, and gets timeout errors. It may be that my shell's
response time is too short for it.

So far I am clueless, and any clues would be appreciated. It sure looks
like a very useful program.

Jim

From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <48ab0754$0$887$ba4acef3@news.orange.fr>
Source record: 3040

Hello everyone,

Overvoltage during a storm 2 months ago killed many devices, including
my computers.
I received my fixed FalCT60 from Rodolphe last saturday, and I'm on my
way rebuilding my system.
I found my HD suffered from the surge, so I'm currently running from
a backup drive with only minimal data - because too few space : the
other was 20 GB, this one only 5, so I can't restore the data from my
backup on tape -.
Now, I own another 20 GB HD, and my wish would be to install the MiNT
stuff on partition Q:\, thus still being able to access data from
other partitions when running plain TOS - unless someone can manage to
make Cubase run under MiNT, which I strongly doubt -.
All my attempts for installing MiNT on a partition over P:\ failed.
Did anyone manage to do so ? Did I forget something ? Did I miss
something among the many pages I browsed ?

Thanks in advance,

J.-Luc

TOS only allows partitions A through P. It is MiNT and Magic that extend
that limit to the letter Z. Unless HDDRIVER extends that limit also for
TOS? Not sure there. Anyway, you would probably be safer just
installing on a lower letter partition, if you can.

Cheers,
JFL

Hello J.-F.,

Well, all partitions up to P: ought to be TOS compatible, until I can
finaly fix my SCSI transfer problems.
I wonder whether it wouldn't be possible to force the installation on
a partition beyond P:...

What do you mean when you say "installing MiNT on a partition over P"? As other have said, MiNT is started from TOS, and TOS does not recognise partitions beyond P:. So your BOOT-partition must be between A: and P:. This means that mint.prg and the mint-folder must be on your boot-partition.

However, nothing prevents you from installing the rest of the system on a partition beyond P:.

I was refering to the LNX partition : if I set it for instance to Q:\ or
R:\ (those exist on my disk), then it refuses to install the stuff.
>
> However, nothing prevents you from installing the rest of the system on a
> partition beyond P:.

So something must be wrong wit my system : it states that there is no
LNX partition, though Q:\ is set as such.
So, I'm going to repartition my disk, give it another try and then come
back here and report.

Have a nice day,

You're not clear: what refuses to install the stuff? The Easymint
installer?

Once again you're not very clear: what system (What OS)? TOS won't show
you Q: because Q: does not exist for it. On the other hand, MiNT will
show you Q: but then, it means that MiNT is already installed.

That's it. :-(
So, is there any way to install the stuff on partition L:\ and then,
when running MiNT, tranfer it on Q:\, then make it know it has to
look for it on Q:\ and not on L:\ anymore?

Okay. If you want to install the MINT folder on C: and the Unix
partition on Q:, then yes, I can't see why you wouldn't be able to
install the Unix folder first on L: then, when everything is running
fine, move the content of L: on Q: and modify the links in MINT.CNF. As
long as both L: and Q: are set to LNX and the copy is done properly
this should pose no problem at all.

Hope this is clear now :-)

Cheers,
JFL

I tried to copy from L:\ to Q:\, unfortunately Kobold seems to have
problems, as it stated some files were duplicate, though they are in
distinct folders. :-/
I found that there are folders with same name but different case too,
particularily in usr/share/terminfo where we can find folders nammed
"a", "e", "l", "n", "p", "q", "x" and the same ones but in uppercase.
Any idea ?

We don't speak about an emulator, so far as I understand the aim.

"
ARAnyM is an acronym : Atari Running on Any Machine. It is a virtual
machine software for running the Atari ST/TT/Falcon operating systems
(TOS, FreeMiNT, MagiC and others) and TOS/GEM applications on any kind
of hardware - be it an IBM clone (read it as "PC" :-), an Apple, an Unix
server, a graphics workstation or even a portable computer.
"

<http://aranym.org/>

This isn't excluding the iPhone, supporting all kind of softwares.

ATARIstically yours =)

Wow. Stop right there. Don't expect Kobold to handle ext2 filesystems.
That's what I meant by performing the copy properly. Use the shell with
the command "cp -au /l/* /q" so that symbolic links are correctly
recreated. TeraDesk or Thing may also be able to handle this finely but
I personally wouldn't bother.

> I found that there are folders with same name but different case too,

ext2 filesystems are case sensitive so "a" and "A" aren't the same file.

Cheers,
JFL

Don't use Kobold. Unless it's been updated since I used it about 8 years
ago, it doesn't understand the access flags correctly and also has
problems with symbolic links. Use cp or tar instead.

> I found that there are folders with same name but different case too,

This is correct. Perhaps Kobold isn't case sensitive?

Hello!

SoLo2 announces demo...

BITS#50

Big sprites,
colorfull raster rolls,
functional music sounds.

http://thebitsclub.tripod.com/BITS50-ST-20080820.ZIP

Greetings,
SoLo2

My TT (and maybe soon my MSTE) has a SCSI->IDE interface, on which a
CF IDE adapter is plugged in, and a 2GB CF card is attached. Works
like a dream!

OK, I finally found that when all seems to go wrong, it's best restarting
from scratch and follow each step so closely so possible.
So, I repartitionned my HD, copyed the necessary stuff to boot from (this
means all MagiC!) and install from - that is : EasyMiNT packages -.
Then I booted from MagiC! and started EasyMiNT, which started doing its
job. But then, it seemed to stop at the point where it displays "Copying
AUTO folder". After more than 30 minutes, nothing had changed, and I was
going to turn the computer off, when I rememberred that it did it either
the first time I tried to install it, about 3 monthes ago. I rememberred
```

too that I had to strike the "Esc" key to go further, which I did. The
HD led lit, then stopped. Then I stroke Esc 2 more times, and it
displayed "Sorting AUTO folder", then I had to strike "Esc" 2 more times
and it went on the screen where it displays it must reboot, aso.
The new installer seems to set up correctly the netware data, but I copied
the ones I had saved from my previous install, thus being sure it would
work straight after. ;-)
So, no more need to copy from l: to r: and then modify config files. Just
install and copy 8 (or, at least, 2) files, and all runs fine. :-)
Forget Kobold problems with following some links. :-/
Just a minor problem with a partition, but this will be asked in another
post... ;-)

Thanks to both,

J.-Luc

From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <48b2d862$0$882$ba4acef3@news.orange.fr>
Source record: 3165

OK, now I have MiNT running from r:\. :-)
When preparing my disk, I set a partition with 4094 kB. It is for very large data that I will not have to access under plain TOS, so it is Q:\ - just before the lnx one ;-) -.
I tested it under MagiC!, which let me copy/retrieve data to/from it with no problem.
But MiNT seems not to like it, stating something about fat being too small, and this is reported when trying to access the drive too (I use Thing as a desktop).
There are 2 alertboxes displayed then :
- for Thing, "No information available about drive Q:! (TOS -46)"
- for XaAES , "pid 104 (thing): FATFS (Q): FAT too small (FAT size = 8174, minfat = 8175)"
I tried to change the value of cache into mint.cnf from 4096 to 6144, then to 8192, but it didn't help. :-(
What might I have done wrong ?

Regards,

J.-Luc

What type is the partition? If you just want the data to be accessible
only by mint, you should go for ext2. For MagiC/Mint I guess F32
should work, but I never tried it.

J. Luc , you should give more datas here.
Not to mention that 4094kB is too small for anything :-)
I assume that it is 4GB. Is it FAT32? With what SW you created that
partition?

Very likely, not the size of partition is the problem, but parameters
of it.

As I tested Mint works well with FAT32 partitions up to 16GB, even
32GB , depending on sluster sizes.

Well, I use HD-Driver in its latest release - 8.22- from Uwe Seimet,
and it is a f32 partition.
But what do you mean by parameters of partition being the problem ?
HD-Driver manages all by itself, just tell it the size and type of
the partition you want to create
What puzzles me is that MagiC! can read it correctly, but not MiNT.

## 3502. anybody remember Tiger?

Newsgroup: comp.sys.atari.st
Date: 2008-08-27 05:10:02 UTC
From: Peter <pmkienle@acmerecords.com.invalid>
Message-ID: <pmkienle-27C3B1.01100227082008@comcast.dca.giganews.com>
Source record: 3170

My ATARI STs have been dormant for many, many years. I turn them on every once in a while just to see if they still work (they do!). Now my wife asks me how can she have a small setup in her office at school to record a few MIDI tracks and playback through her keyboard.

She was talking about buying a MIDI interface for the Windows PC they gave her and some sequencing software. Now, we are really Macintosh people here and I just know that she would keep calling me all day long with questions about why this doesn't work or that.

Then I remembered that I used to use Dr. T's 'Tiger' to record. And since the ST has a MIDI interface built-in it would be easy to setup. I went searching for the Tiger original floppy - which I actually found. It works fine. And I can launch Tiger from the hard disk, too, as long as the original floppy is in drive A. The problem is, I would rather not give my wife the original floppy because after such a long time it might just go flop!

Since I have not worked on an ST in about a decade I am not in the picture anymore how to cope with this situation. It would be a great opportunity to put that good old ST back in business.

Thanks

Peter

If you go to the console and try commands like "ls", does it work?
"df" would be a good idea too. If those work then it might be the
desktop's fault and not the OS'.

Good luck

Well, I remembered that ST Format had put Tiger and Omega on one of
their coverdisks. Have a look here: http://stos.atari.st/stf.htm,
download the disk with a greek omega and try it out, maybe it doesn't
have protection (because I assume that this is the issue here).

Regards

As I know we need to init FAT32 partitions after partitioning with Hddrutil, before using with Mint. There is mkfs util for that. I did not test latest V., 8.22, but no reason to think that FAT32 init is changed.

FAT32 partitions may have diverse parameters as cluster sizes, reserved sector count, number of bootsectors, some IDs, etc... As I see, Mint32 works well with partitions created with Windows. Myself made partitioner which can init FAT32 parts., but their format is taken from sample FAT32 partitions made with WinXP.
As authors of Magic and Uwe Seimet worked tight together it is normal that Magic and Hddriver understand each good. Btw. Uwe said that he even did not test latest hddriver with Mint.

So, you need mkfs for Atari.

Ooooooops! As it was accessable under MagiC!, I thought it would
be under MiNT as well. :-/
A little "mkfatfs Q:" made it MiNT readable.

His sons were computer savvy and undoubtably used them.

FWIW: A president/CEO using a computer in the 1980s would have been considered something like handing George Bush a shovel to fix New Orleans.<Not that it isn't a reasonable idea but for punitive value>

The computer tasks available like word processing or spreadsheets would have been considered a waste of a CEO's time. That is what they have minions for; secretaries, bean counters, that kind of thing. Least we forget, there were Atari PCs so there is a good chance they were in play as opposed to STs.

CEOs only look at distilled data if they are doing their job. Balance sheets vs. individual accounts or paychecks.

Rick

Yes. http://www.ppest.org/atari/floimgd.php

Or may do it with Steem emulator. There are even some programs for
Ataris. But it is for hard disk users.

Good point. I forget that things like the WWW and email weren't a part
of the corporate head's arsenal of business tools back then. I'm sure
corporate heads use computers for more than communication (email) now
though.

Thanks

I'll check that out. I believe the copy protection is the reason I don't
have a safety copy of the Tiger disk.

In the meantime I also found my original disk of Cubase lite - manual
and everything. This one I have copies of. And it runs fine. Except:
It bombs on my MEGA STe (Tos 2.0).
It works fine on my 1040 (Tos 2.05)
Even works under Nostalgia 1.4 on my Mac (ok, I haven't tried the MIDI
part, but it doesn't bomb. I tried that under TOS 1.62 & TOS 2.05.
DIdn't have a TOS image of 2.0 to test that.

Any thoughts? The MEGA STe would be better for the setup.

Thanks

Peter

Any idea what the difference might be between a partition initialized by
MiNT and the partition created by HDDRUTIL?
This is the first time I hear that MiNT needs a special treatment for
FAT32 partitions.

Maybe it's a cache issue. Try turning it off (on 16mhz) or forcing
8mhz.

I really don't know.
I thought that either setting the partition a&s F32 while creating
it or converting it as F32 afterwards would make it readable for
MiNT, but unfortunately not. I had to convert it using the right
command under MiNT.
Maybe might I make 2 partitions on a spare drive, one just created
as F32 and the second converted under MiNT, then save the MBR, FAT
and DIR entries into a file and send it to you ?
Unless someone near you can create the partitions and bring you the
drive so you can explore it ?

Thanks

Figured it out. Man, it's been sooo long. Atari is so hands-on! Cubase
Lite doesn't like Universal Item Selector 3.

Yes I remember Tiger and Tiger Cub. I have both and they are great MIDI programs. I have used them with my old MT-32 MIDI module. They both workgreat with it. Too bad no Atari MIDI programs that are still supported. The last one that I know of that was, was Sweet 16 which I also own. Sweet 16 may still be suported, it is just I have not been to their website in a while. I bought it about 3-4 years ago. Nice program.

Hello all,

I finally received my CT63 upgrade for my FalconI will soon start the long task of putting my upgrade Falcon motherboard in my older Hades tower. Extending most of the ports should be no problem as I have most of the stuff I need to do this. There is one thing I can think of that I need some advice. I bought an Effiel (sp) interface. I need something plastic to attach it to and then be able to attach it to the back of the tower. Anyone know of anything I can use?

From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <48b81036$0$968$ba4acef3@news.orange.fr>
Source record: 3196

Hello,

I'm currently doing some testings, which need that I can use lfn
straight from TOS.
This is only possible running a small utility nammed BigDos. Or,
should I write, it ought to be possible.
Because the utility needs to be configured using another samll
utility nammed Setter, from HS-Modem package - yes, I know, that's
all remind everyone here very old memories ;-) -.
The only problem is that all versions of setter I tried report
the file being dammaged or needing the use of a newer version of
Setter. :-(
The ugly thing is, that there is no newer version of setter than
the one I found on the net - and that I already owned anyway -.
Any idea about this ?

OK, I own another utility nammed Setter.PRG (not TTP!).
When I used it first, I saw what I thought to be garbage. In fact,
I just realized it actually displays the same strings as the TTP
version, but with no CR - that is, the CRs are displayed as part
of the string, as characters -.
Now, when I open BigDos and then double click on the first line,
it opens a window with 3 x 4 fields.
What I don't understand, as it is to set up drives type, and as
the accepted values are stated to be from -32768 to 32767 though
there can only be 4 drives types (0 to 3), is how I must fill the
fields.
Must I name the drive and then assign it a type, typing something
like "D=1", "F=3", etc. Or must I assume that the first field is
for the first drive and so on ?

It would be good if you write little more relevant details. For
instance what exactly want to do with BigDOS...

I worked a lot with BigDOS, and never needed Setter. But user must
know what are the limits of BigDOS, FAT16 filesystem and TOS.

Btw. I tried to contact Reiner Seitel to ask him some things about
BigDOS and Setter, but it is impossible.
Nobody knows his working e-mail or where is he... And I'm afraid that
nobody other will tell you about setings. But maybe you don't need it
at all...

> instance what exactly want to do with BigDOS...

I need to access and modify many files with a software that only runs
under plain TOS.
Those are lfn, with names that beginning is the same.
They represent about 3 GB total space for about 13000 files in
something like 1700 folders and subfolders.
If I edit them under TOS, their names are truncated when saving.
One solution would be to rename them under MagiC!, then edit them
under TOS, and them rename them again under MagiC!.
This would need to transfer some files to a partition that TOS can
handle, then edit, and so on... it would take me ages before I have
achieved tenth of the job. And that can't be automated, because it's
highly "human-brain-dependant". :-(
>
> I worked a lot with BigDOS, and never needed Setter. But user must
> know what are the limits of BigDOS, FAT16 filesystem and TOS.

From what I understood, if I let it as-is, BigDos will set all the
partitions to GEMDOS type, and my need is to access one 4 GB lfn
partition, which I think must be ISO-something.
Last time I tried to use BigDos - loooong time ago -, it corrupted
my entire disk. :-( I think, now, that was because it wasn't set up
correctly. I don't want it to happen once again. :-8

Hello,

I hope this issue will be the last one...
I use a PC keyboard via Eiffel on my FalCT60.
Under MiNT, despites KeyEdit with which I created the Keyboard.tbl
that I placed in c:/mint/1-16-cur/, it just behaves as a plain
Falcon keyboard for Alt-chars, so I can't access them the way I used
before (when I ran MagiC!). :-(
Any idea what I should do to correct this ?

Bonsoir

Download on my homepage or directly in the folder
http://rajah.atari.org/files/ if you are used to the archives names

> Litchi 1.1D (GEM ftp client)
- no more crash under monoTOS after upload or download file (av_path_update
should not have been called under monoTOS)
(thanks Cooper and SimonSunnyBoy).
- Tab instead of Space to swap windows

> KK Commander 1.1C (Total Commander mock-up)
- fix: correct options if right-click/pop-up menu in disks list
- confirm is now by default, in the copy/move formular
- space: no more swap windows, now select file under the mouse pointer
- fix: column positions correctly saved/read
- fix: font height correctly saved/read
- add .APP as launchable
- F2: swap windows contents and new dir

For KKcmd, I will keep this version on my website, for people who need
a small and not-too-fat program.
I'm working on floopy disk hard and soft format, and CRC32. KK will grow
a bit fat: want to add floppy format and MSA management (including opening
a MSA file and list files and extract them).
Studying also: split/unsplit ï¿½-la-Total-Commander and maybe pkzip
managment if I find some understandable C source or PKZIP.LDG

Voilï¿½ !

Hello,

I think I have some problems with time server. Thoug the clock in my
computer displays the correct hour, the one displayed on the messages
I post is shifted -1. I think this was due to the data in the config
file for STiK.
I've currently changed for fr.pool.ntp.org, and I hope the hour for
this post will be correct.
Should this not be, could someone advice me a correct timeserver ?

Regards,

J.-Luc

I don't know anything about Eiffel, but I've tested KeyEdit on a Falcon040
with a TT keyboard, running the current FreeMiNT kernel and Alt-keys work
fine. The Eiffel interface is very configurable, I recommend studying the
docs thoroughly.

Yep, I can at least attest to this with Leonard. Found a few JPEG pictures
stored on his hard drive. But then again, other male employees at Atari did
this too on TT030 workstations.

It's obviously nothing to do with the timeserver that is declared
into STiK's config file. :-(
In everything I post, the hour is wrong (-1 hour), though the one
displayed on the taskbar is right (as well as the one that fastly
appears when booting).
So, it isn't a matter of a timeserver, but something that isn't set
correctly. Unfortunately, I couldn't find it so far. :-(
Any idea where I should look for - before I get nuts - ?

BigDOS can work with max 2GB partitions. And itself supports not
long filenames.
So, you will not be happy with it. 4GB FAT16 is barely used, only
under Win NT, as I know,
Not much support for it.
Btw. BigDOS sets not all partitions as GEMDOS, only Big FAT16
partitions from >32MB and <2GB.
Is it FAT16 for sure? Not FAT32 ?

What system? If SpareMiNT, you might have an incorrect timezone
in /etc/sparemint/timezone. If not, I don't know.

Message-ID: <g9kmjf$n5p$1@reader1.panix.com>
Source record: 2960

Lichti works just fine. The problem was mine. The configuration file had two different configurations in it. Cleared it, started over, and it worked.

Will get the newer version, which does not quit after working in single TOS. My MiNT box died in its sleep, then its power supply went up in real flames, and is in the process of being fixed.

Of course I will register it, as soon as I get some Euro to do it with.

Jim

Source record: 2961

Even when I was until now to leave any feedback, I'm regular
downloader / user of KKCMD and Litchi.

First -- many thanks for this nice software!

Second -- do you think it would be problem (for both products) to make
just one window instead of two as it is now. Of course, both
approaches have their advantages but I don't know... it feels strange,
esp. with that KKCMD in comparing to TC (which is your model). Another
thing would be use of Insert / ClrHome keys -- esp. that Insert is
more intuitive than shift+arrows.

But this is only my opinion, feel free to ignore it ;-)

No really need for that. I say it's a shareware, but in fact, it's more
like a 'donation-ware' (we don't have a translation/habits for that sort
of thing).

> approaches have their advantages but I don't know... it feels strange,
> esp. with that KKCMD in comparing to TC (which is your model).

For the Litchi, I prefer to keep two windows, because the local files
window can be closed and you can replace it by interacting directly with
the desktop, as the old aFTP way.
In the lastest bugfixed version, 1.1D, you can use Tab on every window,
it will top the distant files one, then swap with the local files one.

For KKcmd, well, the problem is that i do not use TC myself...

If in one window, the part of code to manage all GEM objects
(scrollbars, object positions, etc) would be a great deal of work. Two
windows and using Tab is easier and produce smaller code.

So it's possible for KKcmd, maybe in the future, but now I have some
other tasks: floopy formating (finished), floopy quick format, MSA
(should be very easy now i understand floopy format), slipt/unslipt, etc.

> Another
> thing would be use of Insert / ClrHome keys -- esp. that Insert is
> more intuitive than shift+arrows.

I'll study that. Thanks for the suggestions.

Er... it seems far more weird that I thought :
- the hour on my FalCT60 is correct (boot time, taskbar, aso.),
- the hour of a post I sent, when displayed by Troll, is -1, but
- the hour of the same post when I use Google groups is OK!
So... ??? Where do I have to search for ?
>

Easymint is an installer for Sparemint, so your system is really
SpareMiNT. I think you need to edit the file /etc/sparemint/timezone
before running the command you write above.

Yes, of course, I didn't mention it, but I did it before running
the command.
However, if I correctly understood the help text into the file,
it says that it operates at install.
Anyway... the time displayed on my computer is OK, as well as the
one reported when I read the posts straight from internet, and as
well as the time of the mail I send.
But, the time reported by Troll is wrong!
If someone can confirm that the time of this message is something
near 23:57, then Troll is faulty, as it will display 22:57.
Am I the only Troll user that noticed that ? Or, am I the only one
whom it happens to ?

I don't see why not. When the ST was launched there was a good range of
office software, including databases and spread sheets.

## 3556. STacey

Newsgroup: comp.sys.atari.st
Date: 2008-09-07 00:39:57 UTC
From: "andyman@ nowt.com" <curry@takeaway.com>
Message-ID: <48c46ed0@news.greennet.net>
Source record: 2974

I have long since stopped using Ataris , I have a STacey that I bought for an arm and a leg, I put the full 4 meg memory in and broke my nuckles fitting a one gig internal drive and HD floppy,the whole thing cost crazy money,plus due to a wrong repair diagnosis there is a spare screen, It has sat under my desk for many years, is it of interest to anyone?.I would not be willing to post such an old rare item, I live in greater manchester and a buyer would have to pick it up and try it out,I have forgot more than I ever learned about Ataris so no questions please,At the moment I don't wish to leave a real e.mail addy, if anyone is interested I will sort out a contact
Cheers K

# 3557. Update to ACEC Swap Meet 09-13-08

Newsgroup: comp.sys.atari.st
Date: 2008-09-07 12:05:44 UTC
From: fmhcentral@gmail.com
Message-ID: <9b42283e-e6c5-4e28-b130-75cce51e82c8@q5g2000prf.googlegroups.com>
Source record: 2975

Hi folks, I wanted to step in here and give you folk a quick update on the ACEC Vintage Computer and Video Game Swap Meet being held on Saturday 09-13-08 from 9 am to 3 pm in Columbus Ohio. I found out that the westbound lane of Cooke Rd has been closed for construction between
Maize Rd. and I-71. I don't know if this effects the eastbound lane or not. There may be some construction delays. I would suggest that anybody going to the swap meet use the E. N. Broadway exit of I-71.

Please see our website at acec.atari.org. for more information about the ACEC Vintage Computer and Video Game Swap Meet. Or you can email me
at colonel_charles@yahoo.com.

We are still taking reservations for
vendor tables. Also remember that it is FREE!!!! FREE!!! FREE!!!!. Hope
to see you there!

I know you said you don't want to post it, but can you consider
posting it to greece?

# 3559. Ethernet via Netusbee

Newsgroup: comp.sys.atari.st
Date: 2008-09-08 20:20:00 UTC
From: grazey@atari.org
Message-ID: <64126c58-16bd-426e-9ee7-728a41946152@d77g2000hsb.googlegroups.com>
Source record: 2977

Hi,

I've got a Netusbee connecting my 4mb Mega-STe to my PC.

I've connected the Ethernet cable from the Netus to my Netgear router.
My ST has an IP address 192.168.02. I've tried pinging my ST from my
PC and this works.

So far, so good.

Now the dodgy bit. Can anyone give me simple step of how to transfer
files between the two ? I've tried FTPing 192.168.02 from my PC, no
success. I then tried using Litchi but again I'm not sure what to do.

My MSTE is TOS only, is there a solution for this... or must I use
Mint?

Any help appreciated.... had my Netus for over a year and not used it
yet (flooded house problems!)

First off, IP's should have 4 numbers, not 3. My guess is the IP is actually 192.168.0.2, *not* 192.168.02 (unless this was a typo).

> My MSTE is TOS only, is there a solution for this... or must I use
> Mint?

This depends on what drivers and TCP/IP stack you have for your computer. If NetUSBee comes with a STiK/STing driver, you should be ok with TOS and those programs. If it only comes with a MintNet driver, you'll have to use Mint (it is possible to have a minimal Mint setup with MintNet on a slim system), or it might even work with Magic if you have that and MagicNet. I've not used a NetUSBee, so I can't say what drivers it needs. As for networking, once the drivers are running properly, setup is pretty much system independent, and I could help you with that end.

> Any help appreciated.... had my Netus for over a year and not used it

Since you're mentioning TOS i assume you're using STiNG. Do have an
FTP-server installed on your ST?

Try to run a FTP client on the ST with TYPSoft FTP server running on the
PC (http://en.typsoft.com// a free program).

Guillaume.

Thanks for all your speedy relies :)

Yes, just to clarify....

Firstly my ST is 192.168.0.2 (missed a 0 out there)
I have Sting up and running, I followed the guide here :-
http://hardware.atari.org/manuals/netsting.htm

So as I mentioned by PC can 'ping' my ST. This works under normal TOS.

As for FTP servers.. I guess this maybe the *slight* problem ;) So I
need a FTP server set up on my PC..... this is were I need help I
think, plus easy steps on the ST side of things to connect to my PC
(or vice versa)....

I must admit when I bought the NetusBee I thought it would be similar
to PC2Amiga were things ran in the background (TSR) and the PC or ST

drive showed up on each machine.. .but we can all dream :)

Cheers
Phil

It might not matter so much which end is the server, and which the client.

So if you decide that the PC is to be the server, then you'll probably
want to give it a fixed IP address. Ask again if you need help for this.

Then, armed with whatever ST ftp client, you will know what address to
type into it.

There is a solution for this, but IIRC you need to be running MagiC (or
maybe MiNT, just in case anyone is about to jump up and down!) :-)

Hello,

I have done this many times with great success using the FTP protacol. You first have to run a ftp server program on either machine. Get it up and running and then run a ftp program on the other computer and set it to the address of the other computer. The file should come up and you can then either download or upload the files you want.

Sorry but the brain fades. I am sure there is a background FTP server. I think the one I used came from here:-

http://www.ettnet.se/~dlanor/sting/html/file.htm

And I used that with a windows graphical FTP client, but again I forget which one...
.. arrggh but I dod remember I tried a number before I got a pair that worked well together.,...

Any Falcon owners left that have a original Factory 2.5 internal
IDE hard drive, that still works?

If you have one or more, and don't need it, I'm the person you
should contact if you want to get rid of it.
Only need working or was working last time I used it models. 8-)

Also, anyone recently replaced/upgraded a Falcon Internal IDE type
Hard Drive?

I'm interested in known good 2.5, IDE type replacement models
for Atari Falcon 030s. Need Brand, Model number, and size info
for future reference.

You can e-mail me the info, if you do not want to post.

I have a few, not original Atari models but the same Seagate and Conner
models from that era. 45mb, 65mb and 80mb iirc. I'll see if I can find them.

I have an 2.5 4.3gig in my little Falcon and a 3.5 6.5gig in my towered
falcon. No wukka's there.

Mark

Most models from that time that I have seen are SeaGate or Conner.
If you can find those, I'd much appreciate it.

Time to try again. You said you would return my SDX as soon as you found another one. It has now been over three years and I know you have at least two from your posts.

Rick

I have a spare one lying around from last year when I switched my Falcon
from HDD to Compact Flash. It's a Toshiba with 40 Meg or so.

But be aware that those little suckers can become quite loud once the
Falcon is running for a while. That's why I replaced it anyway. Ah,
gotta love that absolutely quiet sound ...

With kind regards,
Dennis Schulmeister

Hi Rick,

I have no problem returning the worn out, water damaged SDX cartridge that
you sent me.

I never could get it fully working. You knew the condition of it when you
sent it.
If you like, I can post your exact e-mails here.
I did remove the case to get at the PCB, to see if a good cleaning could get
it working.

If you like I can fix it, but it will cost you and I don't work cheap, not
anymore.

Sigh.

It is against my principles to post your private emails to a public forem. People in the Atari communitee have known me for over 20 years and I have met many of them face to face in user group meetings. My personality is not in question.

If you would like, I will pull up one of your own posts where you said you preferred my SDX to a later version. If it is so damaged, I don't see why you never returned it. You told me all it needed was the contacts cleaned. Now your telling me you want to pay you to fix it before you return it?

Look if you busted my cart just admit it and return it. I don't hold grudges for stuff like that as I am sure it was unintentional but drop the insults.

Rick

Well it's not against my principles when TRUTH is being distorted.
I'm not asking you to pay anything. Because I refuse to work on it.
It has been in a box for along time. I did attempt to clean it and it did
work for awhile but due to the rust and water damage it was not
stable to use. Why you think I bought another one.

I can reburn the chip or replace the chip, which is the problem.
But that will cost you if I do it. Which I am not going to do for free
and then simply return it to you.

I'll send you the cartridge as it arrived to me, No charge for the
cleaning.
I really don't know why you have made such a big deal over it.
You knew it was damaged when you sent it.

BTW,
I've put up with your cross posting this matter into newsgroups.
The matter should have been kept in E-mail. Things would have
went much smoother.
If you have 20 years experience in the Atari commuity, then you
should know better than to start crap in a Public Forem.

You need to check your email on the topic since your memory seems to be
failing. IIRC: You did not buy a new one, you tried to get an upgrade
ROM and when it didn't work, Mike sent you a free SDX cartridge.

I only asked in the two Atari newsgroups which isn't exactly wild cross
posting.

You really need to take a deep breath and count to 10. Like I said, you
told me you would return the borrowed cart to me as soon as you got a
replacement. Once again, you said you have a replacement that Mike sent
you in July 2005, so what is the problem with returning my cart? I would
venture to guess that most people would consider me to be rather patient
under the circumstances. I will warn you that you are quickly running
out of my good will.

They take a laptop sized IDE, I have replaced many, but over the years they have grown from 250meg, to many gig, I suppose it will depend on the tos limit? or driver software limit., HD Driver was the top dog when I was into the falc

When small laptop drives were very expensive, I shoehorned a 3gig 3.5 into a Falcon with adaptor lead and a bit of plastic removal,

anyone else any ideas?

In year 2008 is much wiser to buy and use some Compact Flash card on
Falcon instead 2.5 inch hard disk.

The reasons: it is cheaper, it consumes less power, it is faster, it
is total quiet...
Easy to attach on PC - good for data transfer.

Contras: needs adapter.

Just avoid cheap no-name cards. Buy some Sandisk of 2-4GB. It is very
reliable and compatible.
Together with adapter it should cost 25-35 Euros.

No Rick, your words were keep it for a year or so.
I did buy another one after you sent yours so update your records.
You didn't seem to want it and I just put it in a box.
You will need to give me your addess again if you want it returned.
I know you have mine.

I don't know of what Mike you are speaking of in July 2005.
Do post that E-mail as I don't seem to have that one.
You seem eager to drag other people into to this.
I've nothing to hide.

I don't fancy threats, however.

Mike sent me a 4.21 upgrade chip that didn;t work. He finally ended up
sending me a complete 4.21 cart. I was very greatful for that.

But ya know, I really didn't see the difference in day to day use.
Unless it was something that I normally didn"t use.

>>

I just ordered a Willem Programmer, that does Eproms, EEproms and
a bunch of other chips. It works on a PC. I ordered it especially
for Atari 8 and 16 projects. But I will need to order a cheap adapter
to do 16 bit Eproms.

I should have it in about a week. Maybe I can burn a 4.21 chip?
I have a copy of the ROM Image.

I can see how that would work. However, on the SDX chip, there were
actually
some rust and corosion that was touching other pins.

I just took a pencil eraser and gently clean that off.

I think it will be ok, I will try it out today.

If the wife doesn't throw a fit.
Dam she hates Computers!

>> No. Only two computers are allowed in the living space. Mine which

>>

WOW, almost sounds like my situation at times.

BTW is she on Anti-Depression medication?

My wife like to play hide and seek with my computer stuff.

She will hide it, and I'll have to seek it out. Especially with
anything new that I get it. As I have a room full of stuff.

Hopefully this Fall, this will change. I have a building beside
of my dads business, that i plan to move all my computer

stuff into, so that I can do as I please without the
disruptions.
My kid will be in school, so I will have sometime for projects
and stuff.

My wife is pretty cool about stuff, It's just she wants no more
computers and things of that sort in the house.
Big waste of time in her opinion.

I have lost a Falcon 14meg memory board, PowerSupply and
a few other goodies that I know she must have threw out as
I can find anywhere. I have backups but God those can be
hard to find and expensive.

>> I found it. Some water damage/mold but none of the pages are stuck

>>

Great about the manual! That will be a big help.

Ahaa haa hee hee, thats funny.

Want to play with her mind? Start hiding her panties and personal
things. She will go nutts!!!

Anyway, I'll take care of the SDX cart for ya. And if all goes well I'll
try it out
today. I need to hook my 8-bit up to a TV as my monitor went out on me.
I think I can fix it, but I found a similar one forsale cheap and bought
it.
It will be a week or so before it arrives.

If ya need anything or just want to chat, just hollar.

I guess your wife would rather you
spent your free time in front of the
TV scratching your arse, and eating
chips and sucking soda pop. ;-)

Don't mess with her stuff, because
then she'll do more than hide yours,
she'll destroy it.

This is just one more reason that I don't
have a partner living with me. ;-)

Very funny.
Anyone can edit a e-mail and post it.
It's a shame you have nothing better to do
than post lies about someone.
About what I expected,

I'll tell you what, instead of me mailing the cartridge,
How about I come in person and deliver it.

For some strange reason it is only my Atari stuff. I mean she is sort'a tolerant of my other stuff. I have several motorcyles, two boats, a dog, fishing poles, , tools, garden, what have you. Something with an Atari logo on it is like waving a red flag in front of a bull! It ain't natural.

Here is a post on the internet from you:
http://newsgroups.derkeiler.com/Archive/Comp/comp.sys.atari.8bit/2006-02/msg00034.html

Over a year after you said my 4.19 version was flaky and unusable. Can't
fake Google archive. Sorry, you lose.
> I'll tell you what, instead of me mailing the cartridge,
> How about I come in person and deliver it.

LOL! Look, here is my problem. There are only two options here

1) You are going through dementia for one reason or another. I suspect
drugs and alcohol. In that case I should let it slide since my friends
in RL and the newsgroup who know me expect me to be a bigger person.
Beating up on an obvious mental defective would be out of character for me.

2) Terry Ortman has gotten out of prison and is using

Barry Shortridge
P.O. Box 210
Mouth Card KY 41548

As a new identity.

In any event, Terry Ortman or Terry Ortman work alike, people will
consider this a fair warning not to deal with you. Our unofficial policy
is not to feed the trolls or reply to the Terry Ortmans of this world.

You have no intention of giving me my cartridge back, I've figured that
much out. You're just a small time liar and petty thief, not John Gotti.
You have no intention of showing up here as at this stage I doubt if you
have a drivers license, car, or money for air fare. You don't evoke any
response from me but pity. I wish you much healing from whatever daemons
are plaguing you.

Rick

You're right. There is something whacked out there.
Have you tried to discuss that with her? Does she say
something like "I don't know, it just makes me nuts?"

More like "The topic is not even open for discussion"

I figure it is something primal like ~nest building. She needs her
beading room, although she has not beaded anything in maybe 10 years and
a sewing table, although she has not sewn anything in 7 years. We both
get computer desks in her scheme of things but I am limited to my
Windows computer.

When I built a small cabin for her "beading and sewing" hobbies in the
hope I could use some of the freed up room in the house for hobbies I
actually do, I kind of got read the riot act about how clueless I am.
Something about how I'm subverting the whole point of being together.

It's probably one of those things you have to be a woman to understand.
I mean if someone would have spent weeks and thousand of dollars

building me an extra room for my hobbies I would have been tickled pink! But then I am a guy so I am not familiar with the ways of a woman. Near as I can figure out is we are supposed to have male and female hobbies and exercise them in the same general area. Almost seems to make sense in some Martha Stewart/Good Housekeeping type ethos. I know of at least one other Atarian certainly better known and more talented then myself that is relegated to his attic.

But heck, I will occupy the cabin and see if my ST still boots and get at least one of my 8 bits running. I know there is something that will jump up and bite me, like I was supposed to build his and her cabins because of the Martha Stewart togetherness thing.<grin>

Fortunately my wife understands that Atari was my first love, so while she does suggest culling things now and then, she actually prevents me from getting rid of some stuff sometimes. (Why I still have an Atari 2600 TV Paddle Games.)

Right now, though, mostly because of our baby, my Atari computer is living inside a drawer under the TV. And mostly it's the baby's poking at things that prevents me from using it much right now. When he grows up a bit, and can actually enjoy video games (more than the amazingly fun power switch), I think he and I will both enjoy all my old toys. :)

BTW - There was an article in some magazine recently about how men need their "man cave" in their home... be it the underground bar and pool room, or the computer dungeon, or the workshop in the garage. I guess my 'man cave' is my laptop + local coffee shop, for now. :)

I"ve been married forty-five years, and feel I should
share some experienced wisdom here.
However, all I can say is 'I know nothing.' in
a Charles Shulz sorta way (Hogan's heros).
I can say I enjoyed my Ataris more with my
grandson than I did with my son. My grandson
went through about a 6 month investigation of
Atari, and got me to give him a 1200XL, and
an old notebook to APE with. He used it some,
but the Wii and internet real-time games are the
present interest, along with Magic cards (1000s of
them.)
I hope I've given you some sound information.

# 3602. 1040STf - Which sockets do ROMs plug back in?

Newsgroup: comp.sys.atari.st
Date: 2008-09-22 02:54:21 UTC
From: Mitchell Spector <mitch2gs@hotmail.com>
Message-ID: <hq0ed49lpkka8rd8he7bda5e51rbiqeu95@4ax.com>
Source record: 2870

Just received an Atari 1040 STf over the weekend, with the catch being the previous owner mixed up the six ROM chips and put them in random sockets! I'm trying to figure out which sockets each chip plugs back into to resurrect the machine.

The sockets are labeled: U2, U3, U4, U5, U6 and U7

The (version 1.02?) ROM chips are labeled:

- C026160-001
- C026161-001
- C026162-001
- C026163-001
- C026164-001
- C026165-001

I tried the most logical thing and put the lowest number in the lowest socket (i.e. 60=U2, 61=U3, 62, U4, etc) but it just powers up to a white screen and the floppy drive won't load. He also included the 1.04 ROMs but I haven't tried installing those yet.

Interesting, on a side topic, it looks like someone modded this. There's 3 phone 1/4" audio plugs drilled into the back with wires leading to the motherboard (best guess, it tapped into the AY-3812 sound chip?). Also a toggle switch next to the floppy drive, with the wire leading to the far end of the floppy ribbon cable (something around pin number 47 or 48 I guess). I wonder if it overrides the write-protect mechanism or helped by-pass copy protection. :)

Oh, got an SC-1224 monitor with it, and a "Monitor Master" switch box, but it doesn't seem to work as a stand alone video adapter for composite out to a TV. Passed up a monochrome Atari monitor which is getting thrown out if I don't take it, just on the fence if I should get it or not. I know it's needed to do 640x400 modes but I just don't have the room for more CRT's. The color screen is rather nice, I'd swear it uses the same picture tube as my old Apple IIGS monitor (nice deep blacks and color saturation!).

This can be a switch to swap A: and B: to boot on the external drive for example.

Guillaume.

# 3605. Atari ST "metal ball" dealer-demo from 80's?

Newsgroup: comp.sys.atari.st
Date: 2008-09-23 02:57:29 UTC
From: Mitchell Spector <mitch2gs@hotmail.com>
Message-ID: <a2mgd49dg5nrefoe0qb2vpp3to96suvs4u@4ax.com>
Source record: 2873

Way back in 1987, I remember seeing a demo produced
by Atari themselves for showing off the ST series in stores.
Basically it was a reflective metallic ball rolling over a flat
surface covered in Atari logos. I vaguely remember the
ball moving side to side as it rolled, or at least spinning.

Anyone know the name of this demo, and if it's available
for download? I'd love to see it again all these years later!

Hmm, you sure it wasn't multiple balls? That makes me think of Xanths "Shiny Bubbles" demo. You could use the keyboard to control it - for example, increase/decrease the speed, start/stop/pause, etc,...

I'm pretty sure I've got that in the files section on my BBS - if you want, send me an e-mail and I'll try to get it to you.

Ahh, sounds very much like it! My memory was a bit fuzzy, it was
21 years ago that I last saw it--on display at a local Compucentre, next
to an Amiga and Apple IIgs. It wasn't one ball going side to side, it was
multiple balls! (and it was the "Atari" name on the surface, not logo).

Did a quick search, the demo was released in 1987, same year
I saw it on display so chances are good that's it!

>I'm pretty sure I've got that in the files section on my BBS - if you
>want, send me an e-mail and I'll try to get it to you.

Found it and downloaded it already (using a program called
Floppy Image & File Transfer 0.97 to get it over to the ST). Yep,
*awesome*, definitely the same demo! I'm sure there are much
more interesting things to look at, but I just had to see this again
for a bit of a nostaligic flashback! :) Thanks!

Just finally getting a chance to explore the Atari ST all these
years later, it's an pretty interesting machine and more capable
than I originally thought!

Mitchell Spector

>CO26165 ST U.S. TOS 1.0 256K (L0) ROM

So these are 1.00 versions of the firmware? That's definitely
interesting to know, but that still doesn't help me as far as which
sockets they plug into. Then again, if H2=[U2], H1=[U3], etc,
then I had them in the right sockets afterall.

Did some searching and found this link:
http://www.atari-forum.com/viewtopic.php?f=15&t=10542&p=84174&hilit=tos+chips#p84174

According the photo (http://www.galaxyzone.net/images/DSC01537.JPG)
I have the ROMs plugged into the right sockets. I also tried the order listed
down the page, in the white box marked "code: select all". Just get the
same results, a white screen, no audio and no floppy activity. Getting a
bit desperate, I plugged in the 1.04 ROM chips, using the order shown
on the same link and that didn't work either.

I'm beginning to think this Atari ST is dead, despite what the seller
claimed. That would be disappointing, but it wouldn't be a total loss
as I did get a working SC1224 monitor, 3 boxes of copied disks, a
video switch box, mouse and a perfect condition keyboard.

Is it possible the guide I used is wrong for the ROMs? Do they plug into different sockets than what I tried? I hate to throw away a perfectly good Atari ST over mis-socketed chips.

Mitchell Spector

According to a script which I used to split modified TOS images long ago:
load tos14x.img 0 64k all -> 0 all
save romh0.u4 32k <- 0 high
save roml0.u7 32k <- 0 low

load tos14x.img 64k 64k all -> 0 all
save romh1.u3 32k <- 0 high
save roml1.u6 32k <- 0 low

load tos14x.img 128k 64k all -> 0 all
save romh2.u2 32k <- 0 high
save roml2.u5 32k <- 0 low

that does indeed look correct.

Did you pick it up yourself, or was the unit shipped? Either case, it might
be bad contact on one of the PLCC sockets - that was a frequent problem even
when the machines were newer. It might help to

- remove the PLCC chips from their sockets (use a PLCC extractor in order
not to damage the socket!)

- carefully clean the sides of the PLCC chip pins and the contacts in the
socket using a fiber-glass eraser pen

- If that does not fix it, *very* carefully pull the contacts in the
(empty) PLCC sockets inwards a tiny bit to increase contact pressure. A
very small hook (like a 0204 resistor with one lead bent into a very
small, sharp hook) helps.

cu

If anyone has photographs of computer retail setups from the 80s and early 90s, I urge you to post them to the web somewhere. It would be particularly nice to see the old Sears setups and the showrooms of stores local to your home town, for nostalgia.

Guess those displays must have been a happier memory for people in the States,
were you allowed to use the computers on display?

Here in the UK a particular consumer electronics chain put a bunch of systems
ready to use within easy access of people, and then the store assistants
were told to go ballistic if anyone even touched the things.
How sad is that?

> Guess those displays must have been a happier memory for people in the States,
> were you allowed to use the computers on display?

I live in the USA and as I recall, we were always allowed to play with the machines. I specifically remember playing with them in Sears, Radio Shack, BEST, Service Merchandise, Electronics Boutique, and Target. Although, most of the Targets did not have the machines operational. I also remember seeing the machines in Toys R Us, but I can't remember if they could be touched or not.

In fact, I would venture to say that as a kid, my favorite store to go to was Service Merchandise. The reason is that they actually had computer tables setup with chairs and everything where you could comfortably sit down and use the computers. They stores weren't busy usually, and there were very few kids. So unlike today with the game machines, there were no fights over who was going to play on them next. I sat down in front of the machines for hours sometimes while my parents shopped around. The employees never seemed to car as long as I was just sitting there typing. They had 3 or 4 different desks and computers setup. Usually they had a Commodore 128, a Commodore Colt, and some other kind of PC setup on a different table that had VGA graphics as I recall. That was the setup for the longest time.

Unfortunately, none of the stores ever had any software running on them, so I usually just played in BASIC on the Commodore units. Sometimes I'd write programs and leave them running for other customers to find.

I do recall that Electronics Boutique had Amigas on display and they would actually have games running on them.

Our local Atari dealer was Software Alternatives. Had a really great guy
for the owner - encouraged everyone coming through the door to grab stuff
and play with it. He sold hardware, software, and did repairs. One time, I
managed to blow parts of a SC1224 monitor and my ST's sound chip up, when
I tried to put stereo speakers in the monitor. I took it to him for
repairs and he had it done the next day - he asked me if I had tried to
hook the monitor up to an Amiga...I laughed so hard I almost cried. :)

One of the saddest days ever for me, when he announced he was closing up
shop. Still, it was a happy ending of sorts. This guy made a small fortune
off Atari, and when he read the writing on the wall, he managed to get out
while the getting was good and retired to somewhere in Florida. Last I
heard, he was still doing great. I'm always glad to hear those kinds of
stories, instead of the usual "I lost xxx money with Atari" kind. :)

I liked the Kmart - they had nice kiosks of Commodore and TI equipment.
And this was '82, when TI hired nice-looking young ladies to demo their
equipment! I remember the one at our Kmart gave me her home phone number!

Stupid me, being the uber-geek I was, I called her alright! To ask her more
about the TI-99! (argh!)

I, too, liked to key in programs on unattended displays, like a FOR-NEXT loop that would give me long enough to vacate the store, then a CALL SOUND with all the voices set to full blast. I'd turn the volume up on the monitor/tv just as I left...

I don't remember Service Merchandise having computers - ISTR that the one in our area closed about two years after I got my telescope through them (this was probably 1979).

I did a lot of shopping at Toys-R-Us (got my Extended Basic cartridge there - $99) and Eckerd's (got Tunnels of Doom there, for $29, it was supposed to be $60 but my friend at the register sold it to me for a sale price that did NOT apply to Tunnels of Doom)...

These days you can walk into a Best Buy and play with the computers, but it isn't the same. The computers are too much alike, and their demo videos are way too boring.

And their "extras" are too "end-user", meaning I was shopping for either a NAS hard drive solution or USB/Firewire. Only the $300+ NAS one was RAID capable, the others were not. I'd like to find a store with hard drive enclosures that offer RAID or not that would allow me to insert my hard drives of choice and do some configuration. We are not *all* blooming idiots these days, some of us still like to choose!

Definately. I never play on demo computers. I mean, once you've
played with Windows on one computer, there isn't much difference on a
different one. I used to like to play on the computers in the stores
because the only platform I knew was the C64 and Vic-20 and so this is
how I first played with MS-DOS, the C128, and even the Amiga for that
matter. Can't remember ever seeing any Apples or Macs on store
displays, but we had those at school and I didn't like them at the
time. I also briefly played with some Atari 8-bit computers at some
store, but I can't remember which store it was. Never could do much
more than type in a few rudimentary BASIC programs, though.

The machines were usually behind clear plastic locked doors, mounted on giant racks. Remember plucking the cards off of their rings and waiting in line at the merchandise booth to pick up your goods? There was fun in that anticipation, lost in this age of instant gratification!

> In fact, I would venture to say that as a kid, my favorite store to go

Ditto!

I spent a summer writing, in BASIC, demonstration software for the C64 and C128 that I would slip into any machines that happened to be running. A curious SM floor manager accosted me, in a very friendly fashion mind you, to ask what I was up to. After I explained myself, he was so delighted he gave me my choice of any piece of software for free. I think they ran my demo until the very last day they sold 8-bit machines.

I remember back then, anyone could touch it and even play with it a
bit. Game carts were chained in to prevent theft but the main systems
were often not chained so if you had bulky coat you could probably
grab a free C64 back then.

The last time I saw any Commodore stuff at Sears, it was the newer
C64-C and a 1541-II drive missing the disk latch lever.

Stores still leave the PCs out on display today but they are often
password protected to prevent software tampering and the keyboard and
mouse were strapped down. Laptops were also bolted in a security case
that allows only the keyboard to be touched.

Was that the same BEST as this?

http://www.best-electronics-ca.com/

They're still down in San Jose. I sadly failed to go visit them during
business hours during the coupla years I lived near SJ.

There's also B & C ComputerVisions, who are still around, and moved out
to El Dorado, California.

Picked it up myself, although this was done using a fold up cart and
dragging it home by bus and subway. I was fairly careful, though come
to think of it, I had to get it down an entire flight of stairs, one push at
a time (rather bumpy there!), getting out of the guy's apartment.

Well, I'll be...your solution fixed it! Pulled out my PLCC extractor,
cleaned the pin's edges with a Q-tip and rubbing alcohol, firmly
resocketed them and viola, it suddenly works!

I think I'm going to stick with my 1040-STfm though. While it does
have a damaged RF modulator (hmm, wonder if that's repairable, it
prevents me getting composite video!) it has a better quality image.
After repairing this 1040-STf and powering it up, I noticed it has faint
vertical lines running through the screen, plus the previous owner
rewired the audio to a 1/4" audio jack on the back (which is nice
but then you can't get audio output from the Atari RGB monitor!).

Now that the 1040-STf is working, I found out the toggle switch on the side does indeed change the internal floppy drive mapping from "A" to "B". Not sure what use that is. Also looks like it has the original 1.00 GEM firmware, I only see a 1985 copyright (whereas my 1040-STfm display 1985, 87). Not sure if I can use the 1.04 ROMs, I seem to remember the motherboard layout being very different last time I opened it. Weird since they're both revision D.

I'll probably give away/trade the 1040-STf, along with the 520-STfm I got several years ago (never really did much with that, since it had only 512K RAM and a 360K floppy).

Here in Melbourne Australia where I live, back in the 80s we used to ride our bikes down to Myers (massive dept store) where they had most of the 8bit machines in display. The TI, Sega and Spectrum computers mattered little to us because we were C64 owners and were there to check out the latest game(s) that came in stock. The display computers were all powered up and functioning and the staff almost never left the counter, i guess they figured kids weren't going to buy the hardware so why bother. They would happily open a software package for us to "try" if they thought there was a sale in it though.

What they didn't realise is we often went down there with a copy of Fast Hack'Em, asked to see the latest game then copied it and went home :)

In earlier times before I got my C64, I would go to K-Mart with my parents and while they sought out whatever it was they were going to buy I sat myself down in front of the demo C64 and kept myself busy. After a full year or so of doing that one turned up for Christmas :)

Don't have pictures but do have plenty of memories.

The store called Video Concepts in Hulen Mall in southwest Fort Worth always had an Atari 800 system set up in the rear of the store, hooked up to a big projection TV with _Star Raiders_ playing. This was in the early to mid 1980s. They also kept the ceiling lights dimmed back there to enhance the effect. I think this is the same store where I also saw audio CDs for sale for the very first time, when they were brand-new. Extremely expensive then. I never bought anything at this store because they were so expensive.

ComputerCraft was a rather large store in a shopping center a couple of miles down the road. They had a few high-end PCs or clones on display there. It was geared more towards the professional business computer user and not kids. The entire store was carpeted and resembled an office environment, IIRC. (Back then an IBM PC XT with a 10 MB hard disk cost well over $2,500!) Today that store, if not the entire chain, is long gone.

I used to haunt the local Radio Shack because they almost always had some computers up and running on the showroom floor. Usually it was the Color Computer. At this time (early 1980s), RS also sold some books filled with short BASIC programs. I enjoyed typing those into the demo units.

Some of the Best stores in Texas are still open. However, K-Mart closed all
of their Texas stores several years ago. Service Merchandise is gone too.

In this area, Montgomery Ward used to have good computer displays set up.
They are gone too. :-(

I used to type in a program something like this (C128 version)

```
10 SCNCLR
20 PRINT "TYPE YOUR NAME AND PRESS RETURN"
30 INPUT A$
40 PRINT A$+" ";
50 GOTO 40
```

The fun was in lurking nearby to watch as someone fell for the bait. First they would stare in awe as their name filled the screen. Most had no idea how to stop the programs endless loop. Then as their name continued to scroll all over the screen, many would become nervous, thinking they had broken the computer.

Some would sneak away as if trying to escape before their blunder was discovered. An occasional honest soul would ask the clerk if they would have to pay for the computer they had just broken.

Some of the clerks were wise to me, and would grin at the customer, then point at me and tell the customer, "I saw him playing with the computer just before you came along. I think he may have done it!"

Computers were more fun back then. ;-)

You must live very near me. I live a few miles from that very mall.
But I never went there as a kid because my parents never went there.
So I have never sen the display you are taking about.

No, that's a different company. Best was (is?) a department/catalog store sort of like Sears, etc, just not quite as big. I think central states only? I'm not sure how far east/west they spread. They were well known for some of their very unusual buildings. One in Houston, TX looked like it was falling down. Big pile of bricks tumbling down from the top of the building and such.

There's another one that from the outside the building looked like it was sinking into the ground on one corner and was tipped about 5-10 degrees. Crazy architecture... The buildings were featured on an episode of Ripley's or That's Incredible or something like that back in the 80's...

Best Electronics I think has always been just the one company in CA...

I can still remember the first computer program I ever learned:

10 PRINT "WELCOME TO RADIO SHACK";
20 GOTO 10

:)

The RS I used to hang out at all the time always had that scrolling
diagonally across the screen of the demo model TRS-80 Model 1. I
actually had to write it down so I wouldn't forget it... I probably
still have the piece of paper somewhere.

I can go back a few years more and recall the Santa Rosa Computer Center (I think that's what it was called), BYTE Shop and ComputerLand (when they had Ataris and PETs) A lot of various computers S100s, Ataris, PETs, Compucolor (ooohhh such nice color back then, even the keys were colorful!), and Apple [[s. Tons of cool computer books and magazines and uber cool devices like wide carriage dot matrix printers and flatbed pen plotters. Also the full wall wallpaper of the moon (lunar surface and forest scene wallpaper was one of those 80s fads) at one had a dot-matrix mural of the moon. Those got my introduction to creative computing magazine and BASIC computer Games.

I used to write BASIC demos on the Sears/Kmart 64s, while my folks were shopping something like:

```
10 for x = 0 to 25
20 ? tab(x);:? "Larry Was Here"
30 next
40 for x = 25 to 0 step -1
50 ? tab(x);:"Larry Was Here"
70 next
```

Later on I had memorized how to code a sine wave and would write a sine messages instead of a zig zag, also changing text color, etc.

One xmas we went to my brother's place in Oregon and I got to get to play an Atari 800 w/ Asteroids and Missile Command at a store (most didn't have Ataris as accessible as 64s), that was something. I also remember in the same mall there was an arcade with tail gunner and some other great Cinematronic games (new then, classic now)

I worked at a computer store in Germany on Ramstein AB. The Audio/Photo Center.

We had Vextrex, Kaypro, Zenith Z-100, Z-150, Apple IIe, IIC, C64, Epson and a few others, but of
course the commodore 64 was my choice.

I used to put up a color bar program. With the Apple IIC and the crappy little green monitor, we
always sold out of Commodore equipment before anything else.

10 PRINT"{Clr Screen}{Rev On}";:FOR x = 0 to 15:POKE 646,x:FOR y = 0 to 39:print "{Space}";:next y,x

16 rows of color bars

Nice one liner that sold many a 64 back in the day. Not to mention the disk of the day I would
leave in the 1541 which of course had a disk copier on it....

Nice subject on this thread. It brings back a lot of good memories.

Keep the stories coming.

There were multiple PCB layouts, some with different numbering for the ROM
sockets (and all other parts).

However, the ROMs work in all models, and a 1.04 ROM set should work in all
machines where the same number of 1.00 ROMs are used. If you have a two-chip
1.04 set, you will need to adjust 2-3 resistors on the PCB to use them
instead of a 6-chip set.

Here in the UK your best bet for playing on machines was the
independent computer shops. One of my particular memories of shopping
in a major chain - Boots the chemists, whose larger stores used to
have an electronics section - is of setting off the "trembler" alarm
attached to a C64 and its Music Expansion System. Very high-pitched.

I nearly missed the bus home once because I was too busy playing Mr Do
on the Atari 800XL in that store, too...

I have vague memories of watching someone play Hitchhiker's Guide to the Galaxy on some kind of Apple back when... In Finland. But I don't think Apples sold that well here, with the usual "Europe pays double" pricing they must've been really expensive...

Well, they were already double or triple the cost of a comparible
Commodore 8-bit setup, so if they were sold for double in Europe, then
I can't imagine how much they would have cost.

It's on the color monitor. The lines are very subtle though, not
something immediately noticable unless you look closely. I've seen
the same effect on old VGA cards and a genlock video card on
my Apple II.

Speaking of monochrome screens, I passed up a 12" Atari
monochrome screen with this system (may be too late to get it
now, the owner said he was throwing it out if I didn't take it).
Is it possible to hook up the ST to a VGA screen to display its
640x400 mode? I even have some that sync down to 15 kHz,
but then I suppose finding a DIN 13-pin to VGA adapter is not
going to be easy.

The last time I opened my Atari 1040-STfm I jotted down the
motherboard part number: "C070789-001 Revision D/Action D2".
I vaguely remember the DRAM chips were underneath the power-
supply (rather than the front end) and it's likely it may only have 2
sockets for ROMs rather than 6. How would you go about getting
it to use 6 chips if there's only 2 sockets? A plug-in daughterboard?
Or just a different set of ROMs?

My main concern with the 1040-STfm is it's RF modulator has
sound but no picture--I just get a black screen. I'd like to repair it
so I can get composite output working. Any tips on how to go
about repairing that?

Mitchell Spector

Heh. Excuse me for not stalking you. ;)

FWIW, I'll be down in the Bay Area for the Google Summer of Code
'Mentor Summit' in late October. Maybe we can grab coffee or something.

Or... maybe I should just plan a separate trip. (I'm a bit of an over-planner,
and end up trying to do way too many things at the same time, rather than just
make a couple of separate, focused trips. :) )

>
> In this area, Montgomery Ward used to have good computer displays set up.
> They are gone too. :-(

The Montgomery Ward store in Hulen Mall in Fort Worth was the only place I ever saw a Bally Astrocade home video game system set up and turned on.

You may remember that Sears used to be the 800-pound gorilla in the shopping world, and if you wanted to sell anything at Sears, it had to have their name on it. That's why Atari manufactured the "Sears Tele-Games System" or whatever they called it, which was just an Atari VCS with a different label slapped on it. Nobody was really fooled, and I think I may have seen one such system set up for play in one of their stores at what was then called Seminary South mall in Fort Worth. But our family never had any pleasant memories of dealing with Sears, and for us Sears was just something we walked through in order to get to the rest of the mall. (Come to think of it, I can say the same thing about the Montgomery Ward store at Hulen Mall.)

When I grew older I went to work in a Sears service center, repairing various electronic items. Much of the stuff that came in for repair arrived from various Sears stores, and they were either customer items or devices that still belonged to the stores but hadn't been sold yet (or were showroom demos). VCRs were still pricey enough to warrant repair back then. We never fixed any video games, but I do recall seeing some very strange, early attempts at custom word-processors that we had to fix. I have no information on any of these, unfortunately. But I feel sorry for the poor dopes who bought them. Not compatible with anything else on planet Earth, and totally useless now. Some even used their own custom forms of floppy diskettes. These were self-contained computers, with their own internal video monitors.

I think it was a BEST store by Ridgmar Mall on Fort Worth's west side where I bought my first electronic typewriter in the mid-1980s. I'd saved up some money (I was still in high school and not rolling in cash) and bought an Olivetti Praxis 20. It used a daisy wheel with film ribbons to allow you to back up and correct mistakes, but it was no computer by today's standards; no video display or anything. But I didn't do my homework before I plunked down the cash; I did not realize until I got it home that those ribbons were not re-usable. One ribbon was good for about 20 pages, and that was it. If that wasn't bad enough, I also discovered that replacement ribbons were available ONLY from that BEST store! Nobody else in town carried them. And

BEST only had a few extras on hand at any given time. I eventually was able to buy a cloth-ribbon cartridge, which was re-usable, but the experience turned me off on BEST and Olivetti products forever. When the typewriter eventually broke I took it completely apart and salvaged it for parts. Taught me a bitter lesson. The store closed long ago and I don't miss it one bit.

Today I live in Arlington, TX, but my parents still live near Hulen Mall. But I haven't been inside the mall for ages. My sister used to work at the Hulen 6 movie theater, which has since been closed and boarded up. The mall has been expanded at least once since I was a youngster, too. I seriously doubt that Video Concepts is still there, given the horrendous turnover of stores in malls. Hulen Mall opened in 1977. I don't think there's a single original tenant left in there. Stores come and go. There used to be a video game store on the second floor where I sometimes bought Atari 2600 cartridges, but at the time I couldn't afford the $50 they wanted for the "Le Stick" Atari 2600 joystick that used mercury switches and allowed you to play games in midair. I have no idea what video game stores are in Hulen Mall now.

When the Atari 5200 system came out, the only place I could find that carried it was Toys R Us at I-30 and Cherry Lane, on the west side near Ridgmar Mall. Is that Toys R Us still there?

There used to be a good computer store on Camp Bowie Blvd. where I actually plunked down the money to buy a software package for my Tandy 1000 computer (an IBM PC clone). Can't remember the name of the store but I bought a copy of a word processor called "Professional Write 2.0." Can't remember how much it was, but it had to have been good for me to go out and buy it. Still have it on the shelf, too, with the 5.25" and 3.5" floppies inside. :) Haven't used it in many moons, however. Too sentimental to get rid of it. I started out on WordPerfect but my pirated copy started acting strange. I got my money's worth out of "Professional Write," however.

I remember Professional Write. A copy came packaged with an XT Clone that I
bought. One thing I liked about it was that it could take full advantage of
the proportional fonts in my Epson printer. Or on the other end of the
spectrum, it could print to file and create a nicely formatted pure ASCII
file which could be easily converted to a nice looking CBM text file. I'll
hazard a guess that such files would be easy to convert to an Atari format
also.

In that case, it might be tolarances - however, bad capacitors in the power supply or on the mainboard, or bad cabling might also be the cause.

It works, but you will probably have to build that adapter yourself - wire mono out to all three (RGB) video inputs on the VGA monitor, connect HSYNC and VSYNC, and ground the mono detect pin on the atari side.

Most VGA monitors will sync to the ST's frequencies, although on some you can't get the image to fill the screen completely.

>Or just a different set of ROMs?

If there are provisions for 6 ROMS, but only 2 sockets, you could retrofit the missing sockets. On later machines, there were really only 2 sockets supported - in that case, you need a set of 2 (bigger) ROMs, or EPROMs. 27C010 EPROMs have 32 pins instead of the ROM's 28 pins, so you need a tiny bit of wiring (or an adapter socket) to match the pinouts.

I never used modulators - FBAS input to a TV gives much better quality.

An oscilloscope and schematics will be helpful, but I am not sure if schematics of the modulator box itself were available - I can not currently find my collection of printed ST schematics. If RGB output works, there is not much outside the modulator box that could cause the problem.

They were sold in Europe (at least in the Netherlands), but one had to
look real hard to find a shop that sold Apple computers. Apple wasn't
nearly as popular as Commodore, MSX, Atari and even Sinclair in this area.

COuld it be to boot on an external 5"1/4 drive with an emulator for
example? But I think that PC emulators can make a soft swap of A: and B:.

Guillaume.

# 3659. [ANN] KK Commander 1.2 (upgrade)

Newsgroup: comp.sys.atari.st
Date: 2008-09-28 16:10:50 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <48dfac89$0$8019$7a628cd7@news.club-internet.fr>
Source record: 2827

Bonsoir

As usual, download on my homepage or directly in the folder
http://rajah.atari.org/files/ -> kkcmd12_uk.zip (70 KB)

News in this Total Commander mock-up:

- fix: when copying/moving, correct dates of files and folders
- fix: when already existing formular - exit click and Enter works
- fix: better disk informations (Ctrl+I)

In icons list, on A or B:
+ floppy disk format
+ floppy disk quick format (FAT erase, keeping bad sectors positions)
+ convert floppy disk to .MSA file (with RLE compression)

In files list, on .MSA or .ST file:
+ can open a floppy disk image as if it was a folder (delay of work if
compressed .MSA file), can walk throught folders and list files.
+ can copy those folders and files to a real folder/disk (ie files extraction)

Ctrl+M is key shortcut on floppy disk or .MSA or .ST files.

Thanks Frost242 and Zerosquare

Voilï¿½

Expected for the next upgrade:
- files/folders selection ï¿½-la-Total-Commander, to manage Insert selection
(ie selected files will appear in red, different from the black cursor).
- split/unsplit of files ï¿½-la-Total-Commander.
- PKZIP ? (at least, trying to list files inside as if the .ZIP was a folder).

I bought Professional Write because it was very easy to learn and use. You probably heard scary stories about how WordStar was to learn; never even touched that. Professional Write was primitive by today's standards (didn't even use a mouse, I don't think, and had no real graphics capability), but it worked quite well. I really loved the cut & paste feature, and programmed some of my own macros to speed up a few cumbersome processes. There was one tiny bug in the program that irked me a little... if you were writing fiction with characters who spoke a lot, using the Tab key so often would cause the program to think you wanted to change the left margin (I may be wrong about the precise details on this... it's been so long ago).

I forget the name of the company that produced Professional Write. They've probably been bought up, sold, merged, split up, bought up again, stock split, folded, spindled, and mutilated several times by now.

I never owned an Atari home computer simply because they were so expensive at the time. And I wasn't that good at typing out demo BASIC programs on them on store displays. Each type of home computer had its own verion of BASIC, and of course not every single command was necessarily transferable. I do remember seeing some TV commercials for the 400/800 computers, such as a father teaching his son how to speak French with an Atari home computer.

Something weird has started happening with my Milan keyboard.

Last week I was having problems getting some keys to respond. I
assumed it was the batteries in the wireless keyboard but the
leds on the receiver puck wer falshing every time I tapped
a key. I changed the batteries anyway.

It has happened intermittently since but today it was working fine
as I was using Texel. Then it suddenly stopped responding to lots
of keys, particularly up, down, left right but Shift-up, down,
left and right still worked.

It is fine in other apps (I'm using Everest now) but if I restart
Texel it behaves oddly again.

Any ideas ?

I was hoping for a pre-build VGA adapter. I did a search and
found someone who hooked up their NEC MultiSync 3D (which
I happen to have) and got 320x200, 640x200 and 640x400/mono
to all display through the *same* cable.

>Most VGA monitors will sync to the ST's frequencies, although on some you

Probably should've just grabbed the Atari monochrome screen,
but I'm just trying to limit the number of CRT's I keep on hand.

I opened up my 1040-STfm, there are only 2 sockets in place. I did
see solder pad locations for adding 4 more sockets, along with a trace
you can cut/open to select what density ROMs are being used.

For the moment I'm stuck with the 1.02 ROMs in this system. Not
sure what features 1.04 adds but much like the monochrome screen

to display 640x400, I don't think it's absolutely necessary for what I'm doing with it at the moment....just exploring and tinkering. Apart from seeing magazine ads back in the mid 80's, I never had a chance to check out the Atari ST back in the day (or the Amiga for that matter) as I went with Apple IIGS instead. Catching up now. :)

I'd like to fix the RF modulator, because, apparently, it's tied in to the machine's ability to display composite video. I much rather use the RGB display, but it'd be nice to have composite if I wanted to bring the ST to other locations and hook it up to a TV set or LCD screen (certainly won't look all that great, but at least it's some kind of video output).

I have a few old broken 1040's . I might be able to remove for you a working
RF modulator from one and send it to you.

I got to dig them out of storage first.

In my view, the best WP software for the Atari was "That's Write" by
Compo Software

I got my brother's Timex Sinclair 1000 when he got a C=64, and played on
both a little. At Sears(?) one day, I tried to program a little program
in BASIC on an Atari 800XL or 600XL, and because I didn't know about the
string restriction (you need to DIMension them first), the program didn't
run, so I thought "fooey!"

Then for Christmas (or was it birthday?) I got a 1200XL. Most awesomest
machine ever. Except that the Rev. B BASIC cart. I had ate my most-excellent
Pac-Man clone. :^(

An 800XL I picked up years later is currently hooked up in the drawer of our
TV stand, with an SIO2SD connected to it, and a bunch of random game and
demo disk images loaded onto the SD card. Sweet and self-contained. ;)

(And above that are the Jaguar, Dreamcast, Atari 7800 and Sony PS2)

Does this still happen if you remove the mouse?

I have seen erratic keyboard/mouse behaviour when the +5V supply for the PS/2 ports (keyboard and mouse) is broken: if a device draws too much current, a PCB trace may blow. In that case, the +5V supply to both ports is broken, and keyboard/mouse get their power only from the pullup resistors on the data lines. If this works depends on the exact model of keyboard/mouse, and usually it works better when only one device is plugged in.

Anyway, you should try:
- a different keyboard/mouse, preferrably a non-wireless model
- measuring the +5V on either port when both keyboard and mouse are plugged in

If the +5V supply is faulty, this can be fixed by soldering a small wire on the PCB.

cu

Fun indeed. My favorite gag was to find an MS-DOS machine and run the
following commands from Debug at the DOS prompt...

```
C:\>debug
-a
137B:0100 mov ax,13
137B:0103 int 10
137B:0105 mov ax,a000
137B:0108 mov es,ax
137B:010A mov dx,3
137B:010D mov cl,dl
137B:010F mov di,0
137B:0112 add dx,9248
137B:0116 ror dx,cl
137B:0118 mov ax,dx
137B:011A stosw
137B:011B cmp di,fa00
137B:011F jne 112
13CE:0121 jmp 10f
13CE:0123
-g
```

Nothing harmful, but made it look like something was _seriously_ wrong with the monitor.

# 3684. Game adaptations page updated

Newsgroup: comp.sys.atari.st
Date: 2008-10-06 13:00:45 UTC
From: pp <ppera@ppest.org>
Message-ID: <c6d24051-e3bf-4b9b-8482-09aef97a2cb7@t42g2000hsg.googlegroups.com>
Source record: 2901

http://www.ppest.org/atari/fromhd.php

Statistic: total 82 titles for DL. 21 was just checked and ZIPPED, 24 easy adaptation and 37 hard adaptation - for running from hard disk, TOS 2.06 , STE and Falcon compatibility, as is in table.
Launchers for many games are redone for easier usage, with some anim. and HW detection. Will be so for almost all.

On page are some demo videos taken from diverse Atari machines with diverse hard disks/cards. + some supporting utils.

Future plans: playing multi-floppy games from hard disk even on machines with not much RAM (512KB, 1MB). It means that no RAMDISK will be used for storing floppy contents but special game cache area on hard disks/cards. It is now part of hard disk driver and partitioner under development. Done 3 titles for GAC: F1 GP (only 512KB is enough), Purple Saturn Day and Battle Command. Soon: Dragon's Lair (7 floppies). It will work with ACSI attached (Satandisk, SCSI drives via adapters - both tested) and IDE (tested too) interfaces. Titles for gamecache will be available for DL as soon as driver will be finished. And of corse, more adaptation will coming...

as for me, you don't need to set such hard conditions -- asking for
1-2 MB machine is quite OK as well. Imagine what kind of users own/use
harddisk? Certainly not guys with 520 ST :)

# 3693. How can i create a GEM OS Floppy In Windows XP or Linux?

Newsgroup: comp.sys.atari.st
Date: 2008-10-10 14:49:41 UTC
From: natemccoy <natemccoy@gmail.com>

I recently acquired an Atari 1040 STe. I would love to use it but do not have the OS on floppy. I only have the computer itself.

Where may i acquire images of GEM OS and how can i write them to a floppy disk in Windows XP or Linux?

Any resources would be helpful as i do not require a lengthy decription. I really just dont know where to start.

Also, Am i considering the right path when looking to make a floppy of GEM OS, or did the Atari 1040 STe come with the OS on ROM?

I had a 1040 STe years ago but am ignorant to all of these things. Any point in the right direction would be helpful and appreciated.

Thank you.
Nathan

GEM isn't the OS. It's part of the OS. And it's embedded into any TOS
machine since 1987.
As it's a ST*e*, it's been manufactured after 1987, so all you need
to start and use it is plug and switch it on.
Moreover, bootable OS floppies wouldn't run fine on such a machine,
as they were made for early STs, which had a slightly different HW.

Arari ST machines have TOS, GEM, Desktop, all in ROM. Only very early versions from 1985 were without ROM TOS, and required bootable floppy with OS.

I gues that you want to do some file transfer in relations PC-Atari ST. I wrote program for that, about 2 years ago :

http://www.ppest.org/atari/floimgd.php

In archive you may find even image files of empty floppies, usable on PC and Atari. 720KB in DOS format, and 800KB in Atari format, but readable under WinXP with Floppy Imager.

If you want to make TOS floppy, bootable, it is possible too (although no need for it, really).

http://www.ppest.org/atari/tosload.htm - Get CREDISK.ZIP . Need some TOS image too. It can be found on diverse places for DL.

Note: with TOS itself, regardless is it in ROM, or booted from floppy you can not do much. You need aplications, games for Atari ST.

Thank you very much, i looked some more information up and i realised
now that GEM is just the GUI for TOS. thanks again for pointing me in
the right direction.

Anyone here know why a the TT030 diagnostic cart would refuse to boot up when a 2MB ST RAM expansion board is plugged in?

I have a TT030 that I'm looking at. When I first was working on it the machine would just turn on with a grey screen (no Atari logo and memtest bootup). I eventually found that there was some corrosion built up on the two FUNNEL chips in the machine. After that the machine would successfully boot.

Then I tried using the diagnostic hardware to put the machine thru an overnight test to test it. But I could never get the machine to boot up with the diagnostic cart but it would boot up with the Terminal Emulator cart. I had installed a TT RAM expansion board and a ST RAM expansion board so that the testing would exercise the expansion slots. It wasn't until yesterday that I discovered this weird issue with the expansion board.

I believe the machine was converted from a UK model (ROMs replaced with US verison of TOS). I'm wondering if there is anything else that would've needed replacement/upgrade when converting from a UK model to a US model?

Regards,
Glenn

Any of those desktopper cases available anymore? Gotta be easiers
that everything involved in transferring the falcon sysboard to a
tower case.....sure been a pain for me!!

Sure like to see some photos of your Falcon if you don't mind.

Just out of curiosity, how much would you want for your Falcon? I
live in Ashburn, Va.

Thanks

# 3708. [ANN] KK Commander 1.3 (upgrade)

Newsgroup: comp.sys.atari.st
Date: 2008-10-19 15:44:57 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <48fb55f8$0$7934$7a628cd7@news.club-internet.fr>
Source record: 2926

Bonsoir

Download on my homepage or directly in the folder:
http://rajah.atari.org/files/ -> kkcmd_uk.zip (75KB)

New features for this bad Total Commander clone:

+ ST-Guide documentation
+ iconification
+ use of AVSERVER to open non-executable files
+ Ctrl+S = save preferences ad paths
+ 'ï¿½-la-Total-Commander' file selection: red or grisï¿½,
when playing with keys, a framing cursor is used.
+ the 'Insert' key selects the file/folder under the cursor
(Merci MiKRO)
+ split file like in Total Commander
+ unsplit file (double-click on .CRC file)
split/unsplit results are created in the opposite window.
(Thanks Dbug/NeXT)

Voilï¿½.

I have to study the .ZIP file format. It's a big piece of cake, so I
prefer to release something now. I'm not sure I will be able to
implement the .ZIP compression in the KKcmd.

Regards.

Hopefully the attachment will come through, I haven't tried to do this
before. The photo shows the Desktopper case plus the separate
keyboard.

I will give the Falcon away to a good home for free. I don't use it
anymore and it is just taking up room. I also have a tremndous amount
of software installed with all of the original disks.

If you are interested, contact me via email and we can arrange a
meeting.

Steve

"Piece of cake" means that it's an easy job, which I don't think you
meant to say ;-)

You can't send attachments to text-only groups such as this - you'll
have to bung the pic onto a web site or email it directly.

Yes, you understand my meaning. Sorry for the bad translation.

I though about "gros morceau" ("big part/slice), and had in mind the
expression "ï¿½touffe-chrï¿½tien" (choke a christian believer), which is
said when the cake is really hard to eat, so dry and copious to chew
that you have the feeling of Death coming near you just before you
swallow the stuff.

Regards

Pierre

I'd call that sort of cake "worthy" I think, with nothing about it to
make it palatable :-)

Lovely expression though, can't think of an equivalent one from England ATM!

# 3716. Wanted Items

Newsgroup: comp.sys.atari.st
Date: 2008-10-21 00:30:40 UTC
From: Mark D <md@md.com>
Message-ID: <Qo9Lk.2664$r_3.1957@nwrddc02.gnilink.net>
Source record: 2934

Hey guys,

Long ago I was just 14 years old and was forced (and I could have
pitched a fit but stupidly did not) to throw away a Mega ST2 with Xtram ram
deluxe, megafile 30, 520 ST and an SC1224 monitor. I've long since
realized how stupid this was and I'd like to acquire the following machines to
complete my collection
520 ST (preferably STe)
1040 ST (preferably STe)
Mega ST
SC1224 monitor (and SM124 if available)
Original Mega STe case (but I have the machine)
external DSDD floppy drive(s)
crazydots cards or other obscure video/network cards
accelerators like icd adspeed
ram expansions...
magazines, disks, software packages, etc. I've been collecting
everything. I even have a 1995 toad computers catalog.and finally - anything that would
allow me to run more than 4MB of ram
in an ST/e based machine. The one that comes to mind is the Magnum
series of ram boards.
I'd like to acquire these machines dirt cheap as I don't have a lot of
money right now. They don't have to be perfect and it's ok if they need
a cleaning or small repairs. I have an extra TT I would consider giving
up in trade but I'd rather not. The TT has broken video (the video is
very dark) and I believe the 5V going to the keyboard needs to be fixed.
It's best suited for remote access running mint or using a video card
like a nova.
It'd probably be best to deal semi-locally only ... I live in Hatfield,
PA
If you want to communicate via email, I'm mducksub and that's at
atari-source.org
Thanks,
Mark

I have a MegaSTE for spares I might part with. its got a standard PC
1.44 (in Atari grey) fitted and milled out professionally as well as a
spare standard Megaste top. Just no ashtray. I will rat thru my parts
for you if you like and see what I have spare. I do have a few modded
STFM's sitting around somewhere.

I'm in Australia tho mate. So monitors may not be practical;-)

Mark

The shipping from Australia would preclude me giving you what the machines are worth unfortunately. But maybe not for the mega ste case. I'd really like a proper Mega STe case.
Thanks,
Mark

# 3719. 20% OFF ALL NEW ATARI GAMES!

I've used Papyrus, Tempus Word, and AtariWorks. Papyrus seemed to work best for my purposes (MS Word compatibility and Web publishing). Tempus Word was good, but lacked some features I needed in some areas and had too many features in others, and the UI was hard to look at (small, jumbled together black and white icons bug out my eyes). AtariWorks was decent, but very basic. If you're not looking for "bells and whistles", then it might work best for you. It all depends on what you're looking for. If you're more into DTP, PageStream was good.

"That's Write" from Compo in the UK was superb and I wish Pagestream
was still around it was great for it's day and they were going to port
it to the Mac - dunno wot happened with that

Can i use an atari joystick for mouse funcionality in GEM OS?
Is this possible? I havent tried it yet.

I do not have an atari mouse but have an atari joystick.

just asking out of curiosity, i cannot find much information about
this.

thanks.

Source record: 2751

Hi,

We are more than proud to announce the release of Ultimate Loading System (or ULS) version 3!

What is this you ask? Simply put, it's a set of routines that let any piece of code run in any part of the system's memory. Not impressive? What about if that piece of code wants to load or save something? What if that code trashes system memory and/or hard disk driver (typically loaded at low memory)?

While this is a generic description, it is meant mostly for making games/demos work from hard drive! This is not an automated process by any means, but it helps a lot in making that possible.

v3 adds Falcon/TT compatibility, picture dumping to disk (.pi1 format), state save/load (if you used it in MAME then you'll be familiar with this!) and more!

Plus! It's open sourced, which means all people can benefit from it!

Head over to http://dbug-automation.co.uk/, we already released the first title using that system, Formula One Grand Prix by Geoff Crammond, fully HD/Falcon/TT/etc patched!

Hi,

You you say "fully HD/Falcon/TT/etc patched", does it still run on a
STE with a Hard drive, or is it now reserved to Falcon and TT?

Guillaume.

I mean it should run on any atari with a hard disk driver.

If it doesn't, we'd appreciate feedback on our forum!

For auction, a deluxe option 2 Discovery Cartridge by Happy Computers,
this is the 2 switch deluxe model with Mac Roms (for Macintosh disk
copying and loading) and extra disk drive port on the back for hooking
up a second drive (discovery cart can also copy with a single drive as
well) and a battery on the motherboard (for a battery backed clock I
presume but I am not sure, I do not have the original manual)

This cartridge is tested and working and in excellent condition!

It is possible top use the joystick as a mouse and I used a small software utility which achieved it but that was a long time ago! I think it was called mouse stick and I probably got it from one of the ST magazines cover disks?

To use the keyboard to move the mouse pointer hold down the alternate key and use the arrow keys and the insert key acts as the left mouse button.

Tested on TT and STE: cool!
Great work.

On the TT I had to remove the CD driver and GDOS to get it running.
Else it hangs after the first screen.

Guillaume.

# 3750. Revisited: HDDRIVER, FAT32, MiNT, FAT too small

Newsgroup: comp.sys.atari.st
Date: 2008-11-02 09:23:10 UTC
From: Uwe Seimet <Uwe.Seimet@seimet.de>
Message-ID: <6n59ruFjkgclU1@mid.individual.net>
Source record: 2768

Hi all,

To Jean-Luc and everybody who contributed to the discussion of MiNT not
accepting a FAT32 partition of 4095 MB created by HDDRUTIL:
I finally checked HDDRUTIL's FAT size calculation and did not find
anything wrong, even though MiNT reports "FAT too small".

Let me summarize the calculation, so that you can comment on it:

When creating a FAT32 partition of 4095 MB HDDRUTIL allocates 8386528
sectors of 512 bytes for the FATs and the actual data area. 8174 sectors
are allocated for each FAT, which means that 8386528-2*8174=8370180
sectors remain for the actual data. There are 8 sectors per cluster,
which means that there are 8386528/8=1046272 data clusters. For each of
these 1046272 clusters a 32 bit FAT entry is required, which means that
1046272*4=4185088 bytes are needed per FAT. This is exactly what 8174
sectors per FAT amount to: 8174*512=4185088.

This calculation shows that the number of FAT sectors allocated by
HDDRUTIL is exactly the number of sectors needed.
If my calculation is right MiNT is wrong and should be fixed. If my
calculation is wrong please point out the error so that I can fix my code.

Best regards Uwe

# 3755. To fix a TT030

Newsgroup: comp.sys.atari.st
Date: 2008-11-03 00:21:44 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <gelg6o$i7t$1@reader1.panix.com>
Source record: 2773

Having had a lot of trouble getting hard drives bigger than 4 gig to work on a TT030, I thought I would try a Compact Flash card, which does not draw much current, and to my surprise, I still had bus problems.

This problem has been getting worse, and having worked as a failure analysis engineer, I thought I knew what the problem was, and I was right, one more time. I went into great detail the first time through, but the process is easy and quick.

Five lengths of number 26 stranded wire, or metric equivalent, in two colors, about 18 inches, or metric equivalent. Strip one end of each, for a half inch (12 mm) twist together, and tin. One color gets laid across the bottom end of pins 1 to 3 of the bottom of the power connector, and soldered to them. The other color gets laid across the bottom ends of pins 5 to 8. Avoid pin 4, which is -5 v.

Pins 1-3 are +5, pins 5-8 are ground. The empty pin is at the other end.

The free ends of one color, mine was green, and leaving one spare, were connected to the plus ends of bypass caps geographically closest to the SCSI chip, the TT memory socket, the back ST memory socket, and the front ST memory socket.

The free ends of the other color, mine was black, were connected to the ground ends of those bypass caps.

When I did this, for the first time, I measured resistance between caps and socket pins, and found that the closest had the least resistance.

The cap ends, after measuring, using a DVM with a semiconductor setting, to see which end was closer to power or ground, were marked with two different colors of paint pen, although anything that does not interfere with soldering can be used. After that, the solution went fast.

This is all done on the bottom side of the board. Having done this, everything seems to work fine, and I have a DVD writer and one ZIP drive on the external bus, and they both work. There is no sign of anything wrong now, and if the printer port fouls up, I have a set of spare wires for connecting to a bypass cap in that area.

If you look at a TT030 motherboard, you will see wide power traces disappearing down very small plated through holes. If they were not heavily plated, a little bit of corrosion, and a lot of power is lost, and things that drive the bus do not get enough to drive it to full voltage. If I had designed that board, the holes would have been much bigger, and the plating thicker.

I have not loaded this machine to its historical full, which was a DVD writer, two ZIP drives, one tape backup, and a scanner, but will get to that, and if on the slight chance that does not work, I will find how to fix that. And I will report on how to do that.

I use a windoze machine at work, and do get work done, but for personal purposes, a TTM 195 monitor on a TT030 is the perfect tool.

This done in pico from MiNT 1.15.12.

>Regards

Rodolphe,

I love my CT60 and it would be nice to buy another CT63 and falcon, but
Falcons are going for $400+ on eBay and are way too expensive. I'm
really not even sure who is buying them! Add to that $200+ for another
CT63, tower case, etc, and there is simply no way I can sneak this past
my sanity checker (wife). Anyway, I have 2 TT's a Mega STe (and a spare
fried mega ste board that I can ravage for parts) and ST's are pretty
easy to find.

What are the chances that we could get a
CT60 for TT? I know this was
discussed repeatedly and you said no before,
but maybe worth bringing up
again. You know I think people with TT's
would be willing to send you
perhaps 250+EUR for a TT accelerator since
we would be just that happy ;)
A Mega STe 68030 board with fast
ram
Mega STe/TT VME video card
ST RAM expansion (16MB)
ST 68030
board...
Newer faster DSP for falcon/ct60 to play with
DSP card for TT
IDE for any of
the above accelerators.

And finally - very interesting to me. A
powerpc expansion for the
falcon. Similar to the blizzard cards for the
amiga. It'd be nice to

have a way to get us all used to PPC to move on
the platform in the
future. The coldfire is very expensive and as tested
barely has more
power than a CT60. Maybe it would be better to
develop for old apple
g3/g4's but just feels fake ;)

I can't help but to
think that after the CT60, such a board would be
easy for you, and I
also can't help but to think every single person who
bought a CT60 from
you has at least one lonely ST lying around that
would love to scream in
ST high with XaAES and MiNT on it and plenty of
spare RAM.

It's just
an idea and of course you should work on what you want to ;)

I know
someone made some board called the Magnum for Mega STe which
allowed 16MB
of ram, but I wouldn't be able to buy this right now for
any amount of
money. A sad situation, especially when you query ebay
for amiga
accelerators and ram boards. Even original A500 can easily
have 8MB.

I am
curious above what you think of all of this and what you want to do
in
the future.

Thanks,
Mark

Yes! Exactly.

> Also, could you state the CD driver and GDOS version? As we are
> working on fixing some bugs, we can investigate your problems.

In fact the GDOS is not a problem, only the CD Driver makes the program
stop (Juste after your intro, I type "space" and the screen remains
white, no answer to the keyboard (even Ctrl+Alt+Del), no sound)

The driver is:
Extendos Pro 2.4
with CD.BOS 3.2B and UNIDRIVE.DOS 2.4A.

The TT has 4Mb ST Ram and 16MB TT Ram and french TOS 3.05.

Other question: no way to play with the keyboard? Only the joystick is
supported in this game? It runs really well on a TT, I remember I played
with the PC/DOS version and I have the same feeling with this one!

Guillaume.

Hello,

I took the liberty to forward this to the MiNT-list, in case there is a
bug in MiNT.

Are you a member of the MiNT mailing list? Frank Naumann posted a reply
today:

"What about the two empty (unused) entries at the start of each FAT
table?"

I don't have a clue what you're guys are talking about, but as he's the
one who's written the FAT-code in MiNT he does atleast know how MiNT
expects things. I suggest you contact him so you can sort out the correct
way to calculate FAT size.

Do these utilities work on a Falcon? I've tried both to get .msa
images back to floppies so that I can use them, but it never seems to
work. When I look at the floppy directory, all I see is msa.app.
What am I doing wrong? Keep in mind that I have never before worked
with .st or .msa files.

Thanks

JayMSA is solid PRG, but has some flaws.
I can recommend to try my PRG of similar purpose, but solved
differently. It works by creating RAMDISK 'O' with content of loaded
ST or MSA image file, or readen from floppy. Then you may write it to
(another) floppy, or modifying content of RAMDISk under regular
Desktop, and then save somehow (to floppy or image file).

Thank you, I will keep his address in mind. For now there is no need
anymore to contact him. After sitting in front of my TT with a pocket
calculator I figured out what was wrong in my FAT size calculation.
The bug is fixed now and MiNT is happy again.
The new release HDDRIVER 8.23 is already available. Details are
available on http://www.seimet.de/atari/en/hddrivernews.html

You can also use a program called DCMSTICK which lets you use a joystick in place of a mouse. I used it when my cat chewed the mouse cable all up until I got a replacement. I recommend using a Sega gamepad as it's better for diagonal movement and it's easier to hold in one hand when also using the keyboard.

It is possible to use the joystick as a mouse and I used a small software
utility which achieved it but that was a long time ago! I think it was
called mouse stick and I probably got it from one of the ST magazines
cover disks?
>
> To use the keyboard to move the mouse pointer hold down the alternate key
> and use the arrow keys and the insert key acts as the left mouse button.

Bravo Sierra wrote:

I think I know what you mean by two speeds. Alt + Arrow Key moves faster or,
lets say each key click moves farther on the screen, or coarser. If you add
the shift key, like Alt + shift + Arrow Key, you have a key click that moves
closer together on the screen, or finer.

Also, an ST Mouse has another use for the Right Mouse Key. 1st) Open two Disk
directories on your ST Desktop. Now you can interact with the Directory that
is not active without activating it. Usually if you try to drag a file off the
directory, the directory becomes active! Unless you first hold down the Right
Mouse button + Left Mouse button while continuing holding down Right Mouse
Button. This allows you to interact with a disk directory without activating
the directory making it the default directory.

I should be able to find the complete package, if you haven't already
found it.

In order for me to get to it, I have to go on a quest which involves
vultures,
and unseen monsters. Reminds me of Temple of Apshai or Alternate Reality.

# 3780. [UTD] ARAnyM's miniPack

Newsgroup: comp.sys.atari.st
Date: 2008-11-10 11:47:17 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <49181F45.4020304@atari.org>
Source record: 2798

Hi,

There's a new 0.9.7beta release of ARAnyM <http://aranym.org/>,
so the *miniPack* <http://eureka.atari.org/miniPack.zip> was
updated. It supports

`MacAranym` allows launching on Macintosh with Mac OS X
`MacAranym JIT` allows launching on MacIntel with Mac OS X
`run_x86.sh` allows launching on PC with x86-Linux
`run_ppc.sh` allows launching on Mac _and_ PS3 with PPC-Linux

So Macintosh - PC - PlayStation 3 are all supported with
both Mac OS X and Linux.

This simple ARAnyM configuration is entirely based on Unices.
Here is a screenshot <http://eureka.atari.org/aranym.gif>

Enjoy =)

Although it is good to see a new Atari programmer if you are looking to make money programming for the Atari you are on a fools errand IMO as most new software released is done so freely. There is some application software such as HD Driver that are good enough and used often enough to warrent paying for them but they are in the minority.
If you have not found them you might want to try asking your questions somewhere like Atari Age, or Atari forum as forums are now more popular than newsgroups, primarily becasue thay do not get spammed.

JayMSA works good. If you work under TOS, make sure to disable the CRC
feature (both for imaging and writing). This did boost the tool's
reliability for me by several 100%.

I've always used ImageCopy for this.

# 3789. VME Graphic card for MSTE

Newsgroup: comp.sys.atari.st
Date: 2008-11-14 18:50:09 UTC
From: Guillaume Tello <houten.van@orange.fr>
Message-ID: <491dc856$0$942$ba4acef3@news.orange.fr>
Source record: 2707

Has someone seen this card with "PROTAR VME ECME VIDEO" on it?

A VME graphic card for Atari Mega STE with VGA output and the serial output too.

Guillaume.

# 3790. [PUB]: New at the Belgian ftp-server

Hi,

Most likely the "serial port" is a 9 pin video port. So just a video
card.

We found what it was (on the french Atari news group)
a ProScreen VME graphic card that gives to the Mega STE the TT High
resolution (1280*960 mono).

Guillaume.

>
> That would be great...and the manual as well?

I checked some of my software storage for this, I've alot of DTP/WP packages
for the Atari.
I located, TimeWorks Publisher ST package. It has 5 Master disks, a
Samples/Artwork disk,
and 3 Graphics disks, such as People,Places & Things.
I have the original Manual and Reference Card which are in a 3 ring
binder/book.

Is this one the same as TimeWorks Publisher 2, or is this a older version?

I used this for awhile, until I got PageStream.
Also, have Partner ST, another TimeWorks program, which has a nice Thesaurus
among other
things, that can be used with other programs or by itself.
All of the TimeWorks packages are good stuff, IMO.

If this manual is the one you need, I can let you borrow it.
If it's the wrong one, then I'll look and see if I have it.

It is refreshing to read that you are programming on the Atari, this
platform can
use all the programmers we can get.

If you want to make money with a program. I would go with something that
could be
transported over to the other platforms, PC/Apple. Such as an original
game, or a useful
application/utility. Do it on the Atari and get feedback from users to see
what they think of it.

If it's good, then look into doing a version for another platform where the
number of users is larger.
Best of Luck and keep programming.

In my opinion it is a great loss, to just give up posting to the Atari
NewsGroups.
I've not seen alot of spamming in here, and one can use filters and etc to
block
spam.
I'd really like to see some activity in here for a change. Getting together
to exchange
info, ideas and etc is the best way to keep this Platform fun and exciting.

And for the formats Imagecopy doesn't handle, try Smurf. There is
also a set of FALCON IMAGE UTILITIES by SKWare One, meant for the
Falcon but some working on other STs as well. Other options are
GemView and Nview.

I ended up finding that I couldn't run the diag on this particular computer
with the ST 2MB RAM expansion board. If I had the board remove the
diagnostic software would run. Quite weird.

Hey Jim,

Do you have a website with photos to help show what you did? Maybe some component references. Trying to follow your instructions is a little difficult without some additional clues to the specific locations you're referring to.

Thanks,
Glenn

Source record: 2723

No, not yet, but I did mail myself a copy. It probably helps to have a field service manual, and secondly, I am not sure I solved all the bus problems. The DMA port supplies most of the printer port, and that does not work, possibly because I killed it. And, after getting all the screws back in, something came loose in the floppy drive circuit, and right now I have little time, and somehow, more important things to do.

If you do not want things on the external SCSI bus, the problems are fewer.

I do have a digital camera that should work with photopc for MiNT, batteries, and a storage card. Just not enough time at the moment.

Jim

# 3811. [ANN] KK Commander 1.4 (upgrade)

Newsgroup: comp.sys.atari.st
Date: 2008-11-26 00:27:36 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <492c97f8$0$28670$7a628cd7@news.club-internet.fr>
Source record: 2729

Bonjour

Download on my homepage or directly in the folder
http://rajah.atari.org/files/ -> kkcmd14_uk.zip (160KB)

News for this bad clone of Total Commander:

- less memory usage (when long list of file to transfer)

- ZIP archive files support (PKZIP). STORE and DEFLATE methods only.

The zip file is opened as it was a folder. Carefull when adding a file,
if same name, the old one will be deleted.

When deleting, zip file is copied into a temp (.zmp) to take only the
wanted zipentries. So you should have a hard disk drive.

DEFLATE archiving and INFLATE extraction are managed by a LDG library
called deflate.ldg (zlib port, see the KKcmd sources), so install the
LDG system. What you need is in the GOODIES folder of KKcmd.

CAREFULL: DEFLATE compression is not yet reliable. Seems to work okay.
Winzip, Macoxs, unzip (from zlib) inflate well, but STZIP fails very
very badly.
So if you have to make public releases, keep using STZIP (carefull also
there, STZIP corrupts zip files when modifications/deletes).
Or tell explicitly to use KKcmd.

INFLATE seems to work well.

Generally speaking, perform some tests with KKcmd before giving
important files (ie test with winzip, macosx unzippers, zlib,
infoZip...).

One more remark: in Options, misc, unselect free disk space verification
under MiNT or Aranym or MagiCMac. If there's too much space, the function
returns false.

Voilï¿½.

Greetings,

Have a question regarding the Centurbo II B version.

Does the 32Mhz Clock signal from the DSP have to be connected
to the Videl Chip in order for the CT2B to work correctly?

Thanks.

Please, do some hard tests on your machines/environments before
you consider KKcmd to be reliable.

Except STZIP unzipping, it's working as expected at home, but the thing
is still experimental.

Regards

Pierre

Hello,

Does anyone know the difference between the NOVA graphic card and the
NOVA Plus Graphic card?

Is the difference in the VME adapter? or is it in the ISA graphic card
itself?

Guillaume.

I believe the difference is in the ISA card. A friend of mine had a Nova Falcon with a 4Mb ATI Mach 64 with VRAM, I had one with a 1Mb ATI Mach 64 with RAM. The former was (IIRC) a Nova Plus.

Yes. Good luck in finding an ISA Mach 64 with VRAM though ;-) I found one
on eBay a while ago, with a starting price of $199!

May not be 100% true IIRC. I have a super nova that was originally a
Nova TT. It wasn't originally mine and the original owner had to get
replacement GAL's from the manufacturer for the VME card to complete the
upgrade.

Thanks,
Mark

## 3825. Re: CT2B Falcon Videl info...

Newsgroup: comp.sys.atari.st
Date: 2008-11-30 20:33:03 UTC
From: redspecter <redspecter@earthlink.net>
Message-ID: <b3c61b2f-9172-47a9-a83a-8a8f36709c7b@w34g2000yqm.googlegroups.com>
Source record: 2743

The CTB2 is not "aware" of whether the 32mhz clock is connected to
anything or not. The absence of this clock will only effect VIDEL
modes that enable the external video clock input. The default TOS
resolutions do not use the external clock, but you'll need it if you
want the higher resolutions/bit depth the VIDEL is capable of.

If you use a screenblaster or equivilent device you can feed the VIDEL
an external clock via the video port of the falcon and achieve higher
resolutions even though the CT2B clock is not connected.

There are probably differences between the TT and Falcon versions. I'm
only familiar with the Falcon version, and the same interface works with
both RAM and VRAM versions of the ISA card.

I have a MSTE/TT version of the Nova, I would think one could use it in a
Falcon with
the Correct Adapter. Does anyone happen to have a spare Adapter?

Can you tell me what wire 3 from the CT2B is for?

Some sources have it connected to pin 1 of socket U63 and some well...

If my sources are correct, The Nova Falcon was sold with either 1MB or 2MB
at the
start. It was really expensive, and the cost between a 1MB or 2MB Nova was
alot.

There seems to be a few different models of the Nova card, such as the
SuperNova.
Memory and graphics power determine the name of the graphics card.

The info I have is,
The SUPERNOVA 64 was a 2 or 4 meg VRAM and the NOVA PLUS 64 was 1 or 2 meg
DRAM.

Also, there seems to be a Mach 32 version, 1 or 2 meg D/VRAM.

There were versions for the Falcon, MSTE/TT. It also came in the "EAGLE" at
one time so say
some.
The Nova could also be used in a Mega ST using a Mega Bus adapter.

I'd like to find a source for all the software drivers and etc that were
created for the Novas.
I'd like to see a few good close up pics of the Mega Bus adapter and the
Falcon adapter.

Source record: 2661

I've a few projects that I've been working on, and after going thru some boxes,
I have located my fairly large Atari software collection.
Alot of Atari ST/E related software on disks already in the .ST file format.
Many of these programs especially the games have been cracked and have nice demos, intros and etc that run before the games loads up or at the title screen.

Alot of effort went into doing these and I must have several thousand files in the .ST
format. ( I've collected this stuff for years)

Is there enough interest in these files for me to create a few CDs and make available?

Or should I just leave them in the boxes?

Many are games, but also have alot of apps/utilities/fonts/text files and etc.
These are from the 80s and early 90s.

INFO : it will possible to cut the PCI slots board to use only 3 or 2 slots.
It will be possible too to cut for only 1 slot BUT you will need to solder a big wire between CT60/63 & the PCI slot to furnish the +3.3V.

Some modifications on the CTPCI and the ATX tower drilling draft is available in the technics area :

Hi,

I have the answer now: The NOVA is limited to 32k colors and the SuperNOVA can go up to 24 bits or 32 bits resolutions (800x600x32b requieres 2Mb of VRAM)

Pretty cool. First impression and tests: the drivers have been improved in speed and the TT with SuperNOVA is as fast as my other TT with Nova and Cattamaran (concerning GEM/VDI calls).

Guillaume.

I'm on thin ice here, but I don't think you can. IIRC there was a
successor to the Mighty Mic 32 that was limited to 64Mb.

Hi,

There is already a lot of SW downloadable on WEB. Practically all
menu disks (games with intros, apps) and programs separately. For
instance on planetemu.net . Some CDs, DVDs are still available too.
Of course, there is always interest for good stuff, especially if it
can not find easy. It would be good if you make some list before
writing CD, DVD. Best if you post about this on Atari forum:
http://www.atari-forum.com/index.php

You can also upload the disks somewhere (newsgroups, file sharing
sites etc) if you can be arsed.

Fair enough, I'll go ahead and put 'em on CDs and make a list available
for comment.
This way at least, the files will be on a safer media. It will take some
time however.
Even though most are already in the .ST format, the shear number of
disks to copy over
and sort makes it a huge task.

I'm not sure that the NOVA is limited to 32k colors.

The NOVA Plus 32 with 1 meg of Ram will get you....
640x480x24bit
800x600x32k
1024x768x256

Also the graphics cards memory effects the number of colors you can get,
in a particular resolution.
My understanding of this is that if you upgrade the Nova's Memory, you can
get
more Colors in Higher Resolutions.

I think that any Nova will give you at least 640x480x24bit,
but I may be wrong as I have no info on a graphics card called just
a "NOVA".

BTW, anyone know about a graphics card with the main chip labeled as
TRIDENT?

# 3862. Crésus Alert

Newsgroup: comp.sys.atari.st

Message-ID: <4944311e$0$28670$7a628cd7@news.club-internet.fr>
Source record: 2680

Bonsoir

Bug report on my Crï¿½sus (banks accounts manager) : while waiting for
the patch/next release this december, please,

-> do not sort/change order in the transactions types table
-> do not create and do not delete a type of transaction

These actions desynchronize the files STREAM.CBD and STREAM2.CDB
When using accounts transfer, wrong type of transaction may be written
of the account target, or a crash (null-pointer) could happen when selecting
a type in the types list or when creating/modifying a transaction.

The bug is fixed on my computers, but please wait for the next release
this end of december. I have to implement archiving inside Crï¿½sus, using
DEFLATE.LDG (the helper ZIPJR.TTP is not CT60-friendly and cannot be
done if pathnames are too long)

Sorry for the inconvenience.

I possibly would be interested. Can you provide a partial list of the programs
that are on the disks?

To me, the more the merrier. I would not want to delete any of the slots. I had four slots on my Hades and that was not enough. I would have loved to have more.

Out of curiosity: what did you have in them? I had no idea there even
was a many as 4 PCI cards available for Atari hardware.

Cheers,
JFL

Not at the moment, sorry.
But, alot of it I have not seen anywhere else.
Not saying that someone doesn't have it, but there is some really
interesting
software and etc.
Alot of the files are in .MSA format too.
In the games, what I find interesting besides the games themselves, are the
built in cheat modes, and demos/music.

If I have to test every .MSA file, by making a working ST disk, then it's
really going to take some time. I've already made a shoebox full of games
from .MSA files and haven't really made a dent into it.
These all worked on my 1040STE, except for a few which I suspect will only
work on a ST/STFM.

To speed it up, I'll have to just copy them over to CD/DVD make a list
and get someone to help check the files before a final release if it comes
to that.

Also there seems to be a ton of Music related software.

I can't say what Edward had in his Hades, but in my Milan I have a
graphics card, two network cards and a PCI Soundblaster. I also have a
SCSI card and a TV card I'm not using.

# 3873. Wanted: Atari Mega ST4!

Newsgroup: comp.sys.atari.st
Date: 2008-12-18 15:17:47 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <alpine.DEB.2.00.0812180715430.19479@slate.spiritone.com>
Source record: 2691
Cross-posted to: comp.sys.atari.st,pdx.forsale

I'm Looking for an Atari Mega ST4. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. Preferably the 6 Chip TOS set as laid out on the MotherBoard. The important feature is this. The built-in floppy must be the Chinon. You can tell, the drive has an eject button centered under the floppy slot. The button is wide, short height & slanted on both the left & right side. This Chinon Drive is the Most Common ST Disk Drive! And the case needs to be unaltered, not cut up to replace a drive with an incompatible eject button. Please direct All replies via E-Mail to Atari@aracnet.com or call Ben anytime (503)256-9974. I need to keep this Within the U.S. as far as this Mega ST goes.

Why insist on a Mega ST4? Why not a Mega ST2 upgraded to 4 Megs?. Answer: I had a Mega 2 upgraded to 4 Megs. The upgrade failed & I don't want that again. I don't care if Jack Tramiel himself upgraded it and Guaranteed it. I want the Mega to come that way from the factory. I don't trust most other peoples tech work. I'd rather have the RAM put in at the Factory.

Atari 8 Bit and ST Games/Software, Hardware/Accessories and Books/References! FREE Catalogs @ http://BenSells.Atari.org or http://BensCatalogs.Atari.org or Catalogs Requested by E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST or Both! Or Call Ben anytime at (503)256-9974!

Hi charles,

Sounds fimilar to me...not sure at the moment, I'd have to do some searching
for it.
I'm guessing that its sometype of application?
Can you tell me about what year it was made and if it was a commercial
release?
Also, what does it suppose to do?

I've seen you post this request for a factory MegaST4 before.
Have you not been able to locate one?

Are factory MegaST4's abit rare?

Just curious, I have one of these, but don't want to part with
it at the moment.

BTW, do you have any motherboard parts for a Mega ST?
I'm looking for a Video Shifter chip. Normally these are socketed.

> I've seen you post this request for a factory MegaST4 before.
> Have you not been able to locate one?

I havent ran this post in a long time, but yes, I was able to locate one.

I need them for my own personal use. I need to setup some Mega ST4s for myself!
I also need Backups. My own personal Mega ST4 needs to be replaced. I'm looking
for Mega STs like the ones listed below for my own personal use. But if someone
should offer me a different Mega ST, I'd still be interested!

> Are factory MegaST4's abit rare?

Not really.

> Just curious, I have one of these, but don't want to part with
> it at the moment.

Good for you.

> BTW, do you have any motherboard parts for a Mega ST?

I'm so very sorry, I dont have a Mega ST motherboard.

> I'm looking for a Video Shifter chip. Normally these are socketed.

I can only recommend Best Electronics or B & C ComputerVisions. On the other
hand, I have some 520s and 1040s I can sell, as is. For Parts! Please Reply!
Please Answer! Please Reply Irregardless of your Answers! Thanx! =-=Ben=-=

Subject: Wanted: Atari Mega ST4!

I'm Looking for an Atari Mega ST4. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. Preferably the 6 Chip TOS set as laid out on the MotherBoard. The important feature is this. The built-in floppy must be the Chinon. You can tell, the drive has an eject button centered under the floppy slot. The button is wide, short height & slanted on both the left & right side. This Chinon Drive is the Most Common ST Disk Drive! And the case needs to be unaltered, not cut up to replace a drive with an incompatible eject button. Please direct All
replies via E-Mail to Atari@aracnet.com or call Ben anytime (503)256-9974. I need to keep this Within the U.S. as far as this Mega ST goes.

Why insist on a Mega ST4? Why not a Mega ST2 upgraded to 4 Megs?. Answer: I had a Mega 2 upgraded to 4 Megs. The upgrade failed & I don't want that again. I don't care if Jack Tramiel himself upgraded it and Guaranteed it. I want the Mega to come that way from the factory. I don't trust most other peoples tech work. I'd rather have the RAM put in at the Factory.

I want to use my ST Xformer to move Atari 8 Bit files onto a 5.25" Diskette! I want to hook up an 8 Bit Disk Drive like an Indus GT or an Atari 1050 using the Xformer Cable and emulator software. I dont want to run 8 Bit Software on my ST, I just want to transfer files to 8 Bit 5.25" Disk so I can run Software on my Atari 800xl! Is this possible with the ST Xformer Cable? Please Reply! Please Answer! Please Reply Irregardless of your Answers! Thanx! =-=Ben=-=

IIRC, there must be a folder nammed STIK_CFG at the root of your
boot partition, which should contain the config file, something
like DEFAULT.CFG.

May this help.:-)

Assembly (to assemble = montieren, zusammenbauen, ...) or assembly line
(Fließband, ...)

BTW, http://dict.leo.org has a nice English-German dictionary and an
active forum about it.

Merry Christmas and best wishes,
Dennis Schulmeister

Bonsoir

Download on my homepage or directly in the folder
http://rajah.atari.org/files/ -> cresus11_uk.zip (220KB)

News in this multiple banks accounts manager:

- fix data corruption in transactions types table
(desynchronization between STREAM.CDB and STREAM2.CDB when
creating or deleting a type or ordering the types list)
- fix possible crash when inserting new type of transaction
+ $F% instead of $F&: speed enhanced, visible on ST and Falcon
+ archiving using DEFLATE.LDG and MEM.LDG instead of .TTP helpers
- no more long pathnames problems
- no more crash of ZIPJR.TTP on 060 CPU
- filters are also saved
- use InfoZIP unzip or KK Commander instead of STZIP
- needs 800KB free RAM (if not, deflate error)
- to install this, the LDG and other files are in the GOODIES folder

Voilï¿½.

For the curious GFA coders, the code is simplified: zip_new and zip_add
(on file at a time). These zipping functions are a bit more reusable in your
code than the shitty KKcmd code.

Have now to work on small release of Litchi and KK...

Hello,

I haven't used an ATARI for internet a LONG time, but I still have my former TT emulated via MagiC-PC on my PC. I just checked the folders and have seen that years ago I had installed STING (not STIK) from Peter Rottengatter on my (now virtual) ATARI. So here is the folder and file name arrangement:

In my "AUTO"-folder there are 2 files, which are the STING.PRG itself and a simple Textfile called STING.INF that just contains information of the folder, where the actual STING related stuff is placed (in my case there is only one line in the file: "C:\STING\" (without the quotes).

So in my case the folder has to be on C:\ in a folder called "STING". In this folder all the rest of STING is placed. There you also find the file DEFAULT.CFG, which contains in my case the following information:

```
#
# This is the STinG relevant stuff.
#
ALLOCMEM = 256000
#
THREADING = 50
FRAG_TTL = 60
#
ICMP_GMT = -60
ICMP_AD = 10
ICMP_FLAG = 0
#
TCP_PORT = 1024
MSS = 2048
RCV_WND = 4096
DEF_RTT = 50
DEF_TTL = 128
TCP_ICMP = 1
#
UDP_PORT = 1024
UDP_ICMP = 1
#
DNS_CACHE = 64
DNS_SAVE = TRUE
#
#
# Here starts the client relevant stuff.
#
```

```
# Used by the Dialer :
#
DIALER = 127.0.0.1
#LOGIN_BATCH = C:\STING\DIALER\LOGIN.BAT
#
```

You see, besides some basic TCP/IP parameters, the last line shows the location of the dialer login script...

So, go for STING by Peter Rottengatter. There you should also find a hypertext for STGUIDE, which should give all the information you need.

Best regards,
Mario.

Source record: 2560

ok all questions answered,

it was released 1988 as it says on my original disk

by trio engneering .

it seems like a more, less common commercial release ,
as it comes in a nice grey and white glossy card board
box....professional apperance...for a release in 1988

it does state that its graphics software ,
but it also mention in detail on reverse of the box how its a script
language
to control parts of other programs , which assemble addons to existing
programs

the inner workings can be harnessed to build programs from other
programs ,, using simplified basic language expressions...
for next do loop while wend.........expressions

ben might be right ,
it could be a part of digispec....i dunno , he would have to send me
a picture or maybe email me the stcontrol part of digispec , in order
for me to sift things out.

i am interested but really have never used st control before so its
not a must have , but just a keepsakes thing where i want to restore a
corrupt disk in my collection.

# 3896. Re: HELP WITH STIK!

Newsgroup: comp.sys.atari.st
Date: 2008-12-22 12:12:05 UTC
From: Mario Charles <mc11@gmx.de>
Message-ID: <494f841f$0$32671$9b4e6d93@newsspool2.arcor-online.net>
Source record: 2564
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here is what the original STiK documentation says, which can be found on
Flinny's page:

http://www.flinny.demon.co.uk/

Quote: "You need to create a STIK_CFG folder (directory), this can be
located on your
boot disk. Either C: if you have a hard drive or A: if you have a floppy
only
setup. If you do not want to create a folder on your boot drive, you can
create
a text file called STIK_DIR.DAT, this file will simply be one line that
gives
the path of your STIK_CFG folder.

Copy DEFAULT.CFG and your default dial script to the STIK_CFG folder.

Copy STIK.PRG to your Auto folder.

Some notes on STIK.PRG location.

STIK.PRG (install in Auto Folder after Hsmodem, can be ran
from Desktop under MiNT). If you desire to run it from the Auto folder
it must run before MiNT. Actually with Naes it doesn't matter so much
where it is ran from. After MiNT seems slightly better though. If
you find out differently, please let me know.

Copy Qdial and it's RSC files to your hard drive. This can be where ever
you wish to have it located. You can run Qdialer as an .ACC file. If you
choose to have it as an .ACC place it and it's .RSC file where ever you put
your .ACC programs.

Edit DEFAULT.CFG and DIAL.SCR to match what your system needs for
connection.
More details of this can be found in the STIKVAR.TXT and the EXAMPLE.CFG
files.

Reboot your system and run Qdialer. Edit any options you may want to change
under the tools icon and save it's config file."

Good luck!
Best regards,
MC.

I have a very RARE Indus Disk Drive for the Atari ST except its a 5.25" Indus made for the ST! It works, it's complete in the Original Box! Please Reply! Please Answer! Please Reply Irregardless of your Answers! Thanx! =-=Ben=-=

Indus GT-1000; Indus; 5.25" Floppy Drive for Atari ST Computers. Plugs into your ST as Drive B:\ the same as any ST Disk Drive except does not have a 2nd 14 Pin Din Disk Drive port to Daisy Chain another Drive! Formats Double Sided/ Double Density. Supposed to do Higher Density 5.25" Disks but I dont have Hi Density 5.25" floppies to test them on. Comes with GT-1000, (2) Manuals, I/O Cable, F.S.I. Utility Disk, Power Supply and Original Box. RARE..NIB.$200 U.S.

Atari 8 Bit and ST Games/Software, Hardware/Accessories and Books/References! I also have one with a 40/80 tracks switch to read both 360 and 720k
floppies.
But I wouldn't tell that it costs $200...

I've got one of those too, but it's not the same brand.

Also, have a program that allows you to use Atari 1050 disk drives on the
ST as a ST drive. But you need a special cable.

I'll keep looking for it.
I've alot of software to go thru and list.

The name had me confused, as I recall a program with a similar name.
But did something different.

# 3901. 16 color palette on st

Newsgroup: comp.sys.atari.st
Date: 2008-12-24 01:41:43 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <4951935c$0$5495$bbae4d71@news.suddenlink.net>
Source record: 2569

I'm interested in some info on the Atari STs 16 color palette.
What causes the ST/STE to be limited to 16 colors and is this limit also
in the Falcons ST/E Resolution Modes and the Falcons normal 16 color modes?

Would it be difficult to increase a older ST graphic programs palette to
more
than 16 colors, if it already works on a Falcon?

BTW, the program is not a game. similar to a paint program.

Every video chipset has a pre-defined palette and colours displayable.
Its all digital. The ST's was limited to 16 displayable from 512/4096
(ST/STE), TT's was 256 displayable from 4096 and Falcon's was 65,536
displayable from 262,144. I think the 320x200 res's were limited to 16
colour on all the machines. The Falcon has a 320x240 mode that is VERY
compatible given the right software. This res can display 65,536 colours
(Falcon truecolour) as well.

The display isn't hackable/configurable in a simple sense. There was a
shifter mod that added a second shifter to an ST/STF/STM/STFM and gave
it a palette of 4096 but apart from that I don't think anyone bothered.
There were a few video card options kicking around, mostly fro the
Mega's and the TT.

Also there were some programs that use a technique called palette
switching. This can fool the machine into displaying its entire palette.
I.e. 512 colours on an ST. This cannot be done from GEM/TOS AFIK. Thru
trickery it is possible to shoehorn 19000 colours out of an STE. Another
thing too, this switching technique is very CPU intensive, most of what
I've seen has been done in assembly. Have a look at a program called
Photochrome for the ST/STE.

> Would it be difficult to increase a older ST graphic programs palette to

> than 16 colors, if it already works on a Falcon?

Depends how it was written I would guess. Hard to say.

>
> BTW, the program is not a game. similar to a paint program.

Good luck ;-)

Mark

# 3907. Wanted: Atari Mega ST4!

Newsgroup: comp.sys.atari.st
Date: 2008-12-25 05:38:14 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <alpine.DEB.2.00.0812242135430.22238@slate.spiritone.com>
Source record: 2574
Cross-posted to: comp.sys.atari.st,pdx.forsale

I'm Looking for an Atari Mega ST4. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. Preferably the 6 Chip TOS set as laid out on the MotherBoard. The important feature is this. The built-in floppy must be the Chinon. You can tell, the drive has an eject button centered under the floppy slot. The button is wide, short height & slanted on both the left & right side. This Chinon Drive is the Most Common ST Disk Drive! And the case needs to be unaltered, not cut up to replace a drive with an incompatible eject button. Please direct All replies via E-Mail to Atari@aracnet.com or call Ben anytime (503)256-9974. I need to keep this Within the U.S. as far as this Mega ST goes.

Why insist on a Mega ST4? Why not a Mega ST2 upgraded to 4 Megs?. Answer: I had a Mega 2 upgraded to 4 Megs. The upgrade failed & I don't want that again. I don't care if Jack Tramiel himself upgraded it and Guaranteed it. I want the Mega to come that way from the factory. I don't trust most other peoples tech work. I'd rather have the RAM put in at the Factory.

Atari 8 Bit and ST Games/Software, Hardware/Accessories and Books/References! ## 3913. TeraDesk 4.00 released

Newsgroup: comp.sys.atari.st
Date: 2008-12-27 01:57:28 UTC
From: vdjole@EUnet.rs
Message-ID: <gj4226$4an$1@news.eunet.yu>
Source record: 2581

Version 4.00 of TeraDesk open-source desktop for the 16-bit and 32-bit lines
of Atari computers is available at:

http://solair.eunet.rs/~vdjole/teradesk.htm

Please note the new location; domain name has been changed because of
recent political changes :( The old URL should still be available for
a while as:

http://solair.eunet.yu/~vdjole/teradesk.htm

The main new feature in this release of TeraDesk is the ability to handle
large disk partition sizes- up to 2 TB, which seems to have become a
necessity with appearance of large hard disks or systems like Aranym.
Other improvements include better formatting of displayed large numerical
values, automatic truncation of long filenames when copying to FAT
partitions, support for links to relative paths, etc. Besides, a number
of (not very critical) bugs has been fixed.

Have fun, and a Happy New Year.

Djordje

# 3914. ST Xformer Help!

Newsgroup: comp.sys.atari.st

# 3918. To fix a TT030 part 2

Newsgroup: comp.sys.atari.st
Date: 2008-12-27 22:06:04 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <gj68sc$a50$1@reader1.panix.com>
Source record: 2586

I have gotten good at replacing Yamama sound chips, thinking that was the reason the printer port was dead.

This time, there is no convenient bypass capacitor next to it to see what end is plus and what is minus with the diode setting on a digital voltmeter, so I connected power jumpers directly to the power and ground pins of that chip, and my printer port works again.

That chip may be found in the Chips and Chips .hyp file for ST-Guide, if you want to see what pin is what, and again you can confirm this with a digital voltmeter (or analog, if that is what you have) between the two relevant pins and the power supply connector pins.

Depending on what you use for glue to hold things in place, it might be a very good idea to line the lower case with waxed paper, just in case.

Jim

Dear Russ, I've added at the bottom a post from Michael Current. He's A great treasure and Atari Resource! Someone E-Mailed me the game I was looking for! I was able to transfer it to a 5.25" Disk so I can play it on my 800xl! I would like to be able to transfer any file this way using the XFormer cable that I have! Unfortunately, the Transfer Utility wont transfer just any file. I need to transfer any file from my ST to 8 Bit using the Transfer Utility!

=-Thanx-=

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from 1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the home market rights to the Atari trademark itself, are owned by Atari Interactive, Inc., a subsidiary of Infogrames Entertainment SA. http://corporate.infogrames.com/

Yes, I neglected to mention the FAQ.
Michael Current keeps up with URLs and
sources for A8, an excellent source.
I have my own archive, but it isn't accessable
except to say something needed and let me search.
I don't have the POOL disks, but I do have
a lot of stuff, CTH archive, Holmes archive,
a German archive, and my own collections from
the days. ftp.pigwa.net seems extensive, maybe
too extensive, as I can't find stuff on it.

# 3935. Coding on Atari Falcon DSP

Newsgroup: comp.sys.atari.st
Date: 2009-01-02 21:17:02 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <495e8452$0$5471$bbae4d71@news.suddenlink.net>
Source record: 2503

Greetings,

A friend of mine is interested in programming and wants to do
some coding on the Atari Falcons DSP.

He is looking for some simple examples from which he can
use to get started and build on.

He's interested in doing Graphics/Video, Audio and Communications
stuff. And wants to try coding the DSP port to work with different
types of hardware, and or build sometype of add-on board for
experiments with different hardware.

He is wanting to know what programming software would be
best for this and needs software examples to get started.

He is just starting out on this and needs beginner info to
start out and advanced stuff to keep interested after mastering
the beginner stuff.

I'm not sure how to get him started on the best course,
so asking for advice and where to find the software and
any reading material. Anyone??

Not sure why the friend of yours can't write for himself but as Adam
pointed out, he can always ask at dhs forum. I've got quite a
experiences with DSP coding but I don't want to waste time for writing
some general answers to some imaginary person :) Dhs forum is being
watched by the well known DSP coders and me ;)

# 3938. Re: Coding on Atari Falcon DSP

Source record: 2506

I made lot of experiments with DSP on Falcon. DSP Programming is a little bit strange but exciting! (like some registers are not always updated after a command or memory use)

A good thing to start is to read Atari Official Developer Kit Doumentation. I don't know an easy way to download it but you can find a scanned version in DjVu format (Page 103):
http://letotd.free.fr/djvu/doc%20dev%20falcon.zip
You will find specifications of the DSP 56001 present in the Falcon and important memory map informations.

In addition, you must retrieve exhaustive informations of Motorola DSP 56k family:
http://www.freescale.com/
You will find useful User Manuals.

> He is looking for some simple examples from which he can
> use to get started and build on.

French ST Magazine published good DSP courses with examples on disks since issue 81 but only in french.
Disks with C and DSP examples:
http://stmagazine.org/
Scans of ST Mag:
http://www.abandonware-magazines.org/
These examples with some kind of optimizations are not always very good in my mind.

Next you will try official DSP 56001 Debugger, Dsp Tools and if you need the excellent PureC:
http://dhs.nu/files_code.php
Debugger is a very attractive tool but not always have the same behaviour as the real DSP. You can find other examples in the archive.
Dsp Tools is a command line tool not user friendly but do the job.

GOOD LUCK.

Yvan Doyeux

> Not sure why the friend of yours can't write for himself

If you mean write code, the answer is he is a beginner.

If you mean why he didn't ask for the info him self.

Well, he feels that he would be put on a Black List, which
could lead to people advoiding him, Job loss, and other
bad stuff that comes with the territory.

He won't even subscribe to this newsgroup in any form.

BTW, he thinks I'm either very Brave or just plain Crazy.

but as Adam

My friend says to thank you for the information.

I think this will help get him started, I also found some
simple examples of DSP code for him to experiment with.

If you happen to come across anything you think will
help, then do pass it along in e-mail or here.

Okay, I prefer here.

# 3942. Re: Help with Atari Emulator!

Newsgroup: comp.sys.atari.st
Date: 2009-01-04 16:26:12 UTC
From: Michael Current <michael@mcurrent.name>
Message-ID: <op.um8qmfbqgaat7c@mdc>
Source record: 2510
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

To follow up, here's what I think I've figured out.

The Transfer Utility Ben mentioned comes with ST Xformer, the 8-bit Atari emulator for the Atari ST. ST Xformer doesn't recognize .ATR image files, the most common Atari 8-bit disk image file format by far, so this complicates things for someone in Ben's situation (with an ST, but no PC handy).

Ben thought he needed image files in the .SD or .DD formats in order for them to be recognized by ST Xformer, so he could use this Transfer Utility to get them to the 8-bit. I had never heard of .SD or .DD. But I just found this in the README that comes with the ST Xformer 3.0 sources:

"The disk format used by Xformer is "XFD" (Xformer Floppy Disk) also known earlier as .SD or .DD depending on the density. In Xformer 2.4 I added the ability to access pretty well any size disk image, so the extension XFD was picked to be a generic case. The XFD format is quite simple. It is just a sector dump of a real 8-bit drive. Take the number of sectors on the disk and multiply by the sector size (128 or 256) and that is the size of the XFD
file. No headers, no extra info."

So that answers the .SD and .DD question, they're just .XFD!

Furthermore, I just rediscovered a utility that runs on the ST that converts .ATR to .XFD image files. "ATR to XFD 1.0" for the ST by Miro Kropacek (MiKRO) is available at:
http://mikro.atari.org/

So, I hope this is helpful to Ben, and any others following along.

Let me know if there's still more to this story than this!

-Michael

Hello,

Happy new Year 2009 to all atarians.

A new batch of 20 CT63 may be produced this month and shipping planned for March (no delay this time).

I need 20 buyers and I have 14.

It is the really last batch because of new projects after (CTPCI and an other ) and the factory difficulty to solder correctly all parts (I had 7 boards to repair on the previous batch ! ) because of the lost of the solder mask inox (too expensive to produce again) when the previous factory closed.

You last chance to get a CT63 on your Falcon.

Price stills 320 EUR.

Some time ago I bought a second hand Atari 520STE, and included was a cartridge which I don't know what is for.

Please, could anybody tell me for what is that cartridge for? Many thanks.

Here are some pictures that I took:
http://fotolog.miarroba.com/f/9/5/0/5826950/1.jpg
http://fotolog.miarroba.com/f/9/5/0/5826950/2.jpg
http://fotolog.miarroba.com/f/9/5/0/5826950/3.jpg

The main chip is named HARTD1 87HCI, but I couldn't find any information in Internet about it.

If that plug fits into an external drive, then I would hazard a guess and
say its one of the cartridges that copy protected Floppy disks, like games.
If thats right, you'd still need the software that came with it though.

Can't remember all the names, but Synchro Express comes to mind.

Just a guess though, mind you. :)

Perhaps it's a Blitz cable. The Blitz was used to copy software,
including most copyrighted programs.

Perhaps if you open the case of the cartridge, it might have
a name and address on it. That could help you determine what
it's for.

Thanks everybody for the information.

Based in what you told me, I searched for some information about Atari cartridges for copy purposes.

And indeed I have found that the connector on my unknown cartridge is the typical connector to be connected to an Atari floppy drive.

Also I have found that one of those cartridges for making copies, called Discovery Cartridge (made by Happy Computers, Inc in 1987) have a HARTD1 chip in it.

Many thanks to everybody for the help.

The HART chip is normally associated with a HAPPY Disk Copier.

I have the Discovery Cartridge, the Large one.
IIRC, they also made a smaller one for the ST that also connected to the cartridge port, but I didn't think it had a cable. ICBW, because I only saw a pic of it. However the case was similar but different.

This Case looks exactly like a Migraph Hand Scanner cartridge interface, except for the
cable. On the Migraph case, there is a small port where you connect the hand scanner
cable, in about the same location where the cable on this one is.

However, I've not taken my scanner interface apart, to look inside.
The GoldenImage Scanner Interface is just like the MiGraph one except the cover
goes over all the PCB, only the cart connection can be seen.

My guess is that it's a Disk Copier of some sort.
Or some type of Disk Drive Interface.
I don't know of any other ST devices that uses a ST disk drive connection.

There is a floppy connector.
It is some kind of one-to-one floppy disk copier.
Here I have a Replica-Box ST from 1987 TECHHart Handelsagentur ROM-Module +
Software that has 2 connectors.
It copies every disk on a one-by-one basis by synchronising both drives.
I think this does the same with one external drive and the internal drive.

The Blitz Cable doesnt look like a Cartridge, it's a Cable. Unlike the Synchro Express that does look like a Cartridge with a DB25 Connector for the Parallel Port. And a plug for the external Disk Drive Port and a Pass Through Port for the External Disk Drive. When you use the Synchro Express it works best with matching disk drive Mechanisms. Look for the eject button to match Mechanisms. The Synchro Express makes your Atari Disk Drives act less Intelligent so Disk Drives are too stupid to fail copies due to copy protection. Synchro Express is my favorite ST Hardware Copier, 2nd is the Discovery Cartridge. Synchro and even the Blitz Cable are an easier way to Backup Copy Protected Software. It takes less intelligence to succesfully copy. Also, when copying, both A & B Drives work simultaneously. I dont have Synchro Express to sell, I love mine! Please Answer! Please Reply Irregardless of your Answers! Thanx! =-=Ben=-=

Perhaps it's a Blitz cable. The Blitz was used to copy software,
including most copyrighted programs.

# 3963. [ANN] Phoenix 5.3

# 3969. Need a program

Newsgroup: comp.sys.atari.st
Date: 2009-01-13 18:07:13 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <496cd855$0$5461$bbae4d71@news.suddenlink.net>
Source record: 2536

I'm looking for a program probably in Basic if possible, that when ran will check the Atari for what type it is and then run a program for the Atari it finds.

For example....

Program runs and finds a 1040STe, then runs Program X which is specifically made for it.

Or Program runs and finds a Falcon 030 then runs Program Z which is specifically made for it.

And extras that the program will find and report such as amount of Ram, Video Display capability and etc. would be good too.
So that Custom programs can be setup for machine capability.

And if it would run in the Auto Folder or normal directory would be helpful.

Anyone up to knocking a program like this out?

Send to your email as well....

I suppose I didn't think anyone else would care than me. Or perhaps
some case layout would benefit from them being on the side. Or maybe the
PCI signals have a shorter run if they are on the side rather than the
back, etc. But thank you for considering it.
Seriously :)

Thanks,
Mark

I really doubt there's some GUI application for such task, however,
it's pretty easy to code.

Just look after cookie jar (_MCH, _VDO, _CPU, ... variables) and Pexec
() (for starting the external program). The Atari Compendium should
give you all the needed info.

We are currently in the market for used Working and Non-Working
Atari Falcons and CLAB Falcons, with/without hardware and software
collections.

Just about any internal or external Hardware such as Digitisers,
Scanners, Hard Drives (IDE/SCSI) DSP Audio Boards, Graphic Cards,
old CPU upgrades, such as AB040, Nemesis and etc.
for the Atari Falcon030 or CLAB Falcon. Are needed.

Also, Working and Non working MegaSTe, 1040STE, 520STE and
TT030's needed.

RGB and Mono monitors also needed, but these must be
in working or known to work conditon due to shipping charges.

Software collections for the entire ST-Falcon range are needed.
Techinal Manuals, Books and Magazine Collections too.

Doesn't matter if the hardware doesn't work, we may take it
off your hands and give you a decent price for it.

Don't throw it away when you can get some cash for it or
trade to hardware/software you need.

E-Mail your list of Items or Item to us at: phantomm@suddenlink.net

All e-mail is PRIVATE, unlike others, we do not sell or give your
personal info out.

We appreciate your help and business.

I for one always trusted their intent. But after seeing how long the
EtherNAT took I had my doubts... Not that I thought they were criminal or
incompetent but it's just a tough thing ;)
I'm glad to see something real. I've been longing for the supervidel or
the CTPCI for a couple years now. Really either solution will give me
some hope.--

Alan arvostuksesta kertoo varsin suoraan se miten alan ammattity�v�est�
suhtautuu tekemiseens�. Siit� voidaan ottaa esimerkkej� laajasti.
Ammattilaiset haluavat usein my�s j�lkikasvustaan ty�ns� jatkajia.
Yritysmaailma on pullollaan ty�st� ylpeit� is�lt� pojalle siirretty�
sukuosaamista. Mutta yksi ala loistaa poissaolollaan. Yksik��n ydinalan
ammattilainen ei kehu firmaansa julkisesti netiss�, lehdiss�, ei edes asiaa
kyselev�lle lapselleen. Jos katsomme ketk� julkisuudessa ydinlobbailevat,
niin yht��n alan ammattilaista ei taatusti n�y lehtiotsikoissa, netiss�
saati mualla. Vain rahalla ostettavia politikkoja ja vastaavia, jotka eiv�t
erota uraania hiilimustasta taatusti.

Rupesin todella ihmettelem��n miksi. Ja ennenkaikkea KETK� ovat maassamme
nyky��n ydinalan ammattilaisia? Heit� on maassamme tietysti tuhansittain,
mutta keit�? Heille on yhteinen piirre se, ettei n�ill� ole esim.
perustuslakiemme mukaista lakko-oikeutta, kell��n! Toinen keskeinen piirre
on niinik�� lainvastaiset ylipitk�t jopa 12h ty�vuorot ja loputtomat
ylity�jaksot vailla omaa p��t�nt�oikeutta. Kolmas ominaisuus on tekem�ns�
ty�n arkaluontoisuus, mik� tarkoittaa orjallista vaitiololupauspakotetta
uhkailu-ukaaseineen ydinjohdolta. Esim. OL-1,OL-2 ja OL-3 ty�mailla ei
KET��N saa menn� vapaasti jututtamaan tekemisist��n ja m��r�ys on ehdoton,
vaikka maamme pit�isi olla demokratia. Mik� kertoo my�s alan valonarkuudesta
ja h�m�ryydest� enemm�n kuin paljon.

Niinik�� ydinty�l�isten palkkataso on enmemm�n kuin romahtanut loistonsa
p�ivist�. Jos lasketaan Suomen ydinty�l�isten ansiotasot saadaan tyyty� jopa
7 euron tuntipalkkoihin! Reippaasti alle jopa siivoojaminimist� puhutaan
ydinalan ammattilaisistamme keskim��rin kautta maamme! Kun viel� 70-luvulla
ydinosaaja oli huippupalkkalainen ja arvostettu, on h�n t�n��n l�hinn�
kansan hyljeksim� reppupuolalainen, liettualaisorja, turkkilainen, yms.
joita katsotaan pitkin nen�nvartta, jopa kaupan kassalla, koska heit�
arvotetaan toki my�s olemattoman orjapalkkaostovopimansa mukaan
olemattomuuksiin. Ja tieto siit�, ett� suurin osa ei maksa edes veroja,
saati sotuja ja vastaavia alentaa tasoa mutasarjaan kansan silmin.

Vaarallisesta ty�st� johtuvat moninkymmenkertaiset sairastumisriskit
ty�tapaturmista, kielitaidottomuutensa takia tulee valtavasti
onnettomuuslis�riskej�, samoin kouluttautumattomuuksistaan, s�teilyst� ja
vastaavista lis�riskeist� kiistatta puhutaan ydinty�l�isiss�. Hyv�ll� ei
n�ihin pitk�lti "slummiparakeissaan "huuhaileviin" ydinorjin suhtauduta en��
edes harmistuneitten kauppiaitten piiriss�. S�teilyvaaransa takia heill� on
normaality�l�isi� ankarammat
l��k�rintarkastusvaateet jne. Ydinty�l�iselle on kauhistus , jos lapsensa
tulisivat samaan ty�h�n jatkajiksi.Voi vaan h�mm�stell� kuinka nopeasti
ydinalan mega-arvostus on romahtanut nykyiseen mit��nsanomattomuuteensa.

heijastellen sit&#65533; pettymyst&#65533; mit&#65533; ydinvoiman loisteliaitten lupausten romahdettua tshernobyliin on tuottanut. Voi vaan arvailla, ett&#65533; kuinkan n&#65533;in totaalisen pettymyksen ala saa en&#65533;&#65533; jatkossa KET&#65533;&#65533;N kiinostumaan sen yll&#65533;pidosta?

## 3982. GEM tiger example image

Newsgroup: comp.sys.atari.st
Date: 2009-01-20 08:07:33 UTC
From: Ian McCall <ian@eruvia.org>
Message-ID: <6tlf24Fbid2uU1@mid.individual.net>
Source record: 2550

Does anyone have the example image of a tiger that used to come with the ST, preferably in a modern format such as gif or png? I was surprised that a quick search for "GEM tiger example atari" on Google didn't come up with anything, unless I'm just being dumb this morning.

Cheers,
Ian

Right! The original tiger was b&w and came together with the 1st Word texteditor, or...?

One of the examples in Timeworks contained a bitmapped b/w image of a
tiger.

Thanks for the info.

I don't think it's the Migraph Hand Scanner cartridge interface,
because my device have a male DIN 14 pins connector, like the ones
that you plug in FDD, and I guess the scanner, even having a DIN 14
pins connector will have a male connector as well.

I guess you're right guessing that it's a Disk Drive Interface.

If it is really a monochrome picture, why using jpg ?
For mono gif or png are more efficient I think.

And what about the original Atari *.img format ?

And so does Imagecopy 4, gemview, zview, etc ... on Atari machines too.

Indeed gif or png would have been a better choice.
Anyway I've uploaded tiger.zip to the Belgian ftp-server. That archive
contains the tiger image in 3 formats, .Img, .gif and .png.

anyone have a rough estimate of how many Atari 16-32 bit owners/users
there are in the USA/Canada and OverSeas that are Active with there
Computers?

the activity in this NewsGroup suggests that alot have stopped or moved
on.

I know of a couple of friends that are working on some Atari related
projects and may release
some of the software/hardware if there are enough Users left that may
actually pay for
shipping costs of a Disk or CD.

Or is there other reasons, why Atari owners/users do not use this
newsgroup anymore?

Maybe some of the Atari Dealers that are left can give a number of
customers in the past year
so we can get a feel of how little of us is left.

# 4004. Re: How Many Are Left? (Atari Owners)

Newsgroup: comp.sys.atari.st
Date: 2009-01-27 09:36:07 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <glmkhv$oq1$1@gemini.csx.cam.ac.uk>
Source record: 2622

IMO the reason there is not much traffic here these days is because poeple
became fed up with the time and cost of dealing with the amount of Spam and
Flame wars that regulary appeared here espically when Sinclap posted
anything. This resulted in a lot of people moving to forums where such
things are easily stopped because...
a) Requiring an account makes it hard to spam whereas spam bots can easily
invade newsgroups.
b) Threads that descend flame wars of otherwise get out of hand can be
locked so that no more posts can be made thus depriving the fire of fuel
c) The accounts of those who Spam or Flame can be closed and so such people
eventually get fed up of having to open new accounts to access the forum and
go away.

Ironically most of the reasons above seemed to have declined in proportion
to the decline in posts here, presumable they think it is no longer worth
the effort but may change there minds when should things pick up.

In addition to this I am sure there are a few who have left the Atari scene
and some for who life has got in the way and have not had the time to use
their Ataris/post. There is also the odd new addition/returnee to the Atari
world but in a time where things like Facebook are prevelent most companies
are using forums of them are probably more used to web forums than newsgroup
or not old enough to really know what newsgroups are, plus unlike newsgroups
you can post/PM someone the file they want or post an image help explaine
what you are talking about on a forum.

There are many Atari forums around such as Atari Age (www.atariage.com)
which has a regular flow of ST/TT/Falcon post. Jaguar Sector II
(http://www.jaguarsector.com/index.php?) which as the name suggest is mainly
Jaguar orientated, although it does have forums for 16/32 but computer is it
less active. Another is Atari Forum ( http://www.atari-forum.com/) this
appear to be purely for all things ST/TT/Falcon, there are probably others
but check these out.

I still have my Mega ST, a 520ST, and a MegaSTE 4MB that are all in storage.
Have a couple of mono and color monitors including the prized PS3000 model.
Just havent un boxed them in 3 years since I moved into our new home.

LS

Finally, after many years of intermittently hard work and
letting myself be distracted by the many beautifull things in a world
that is not entirely made up/out by/of computers, AHCC has reached
a usable state.

AHCC is a replacement for the renown but propriatary Pur C compiler.
AHCC is binary and almost source compatible to Pure C.

You can download AHCC from my homepage (in sig).

The version number is 3.b1
3 after Sozobon v2, b1: the first beta release.
The language version is C89.

Please, please, before you go fiddling, read the hypertext
in it's entirety first.

If things are unclear or if you think the hypertext is too
concise or incomplete, send me a mail.

Have fun.

Now, there's a name I have not seen for yonks - I have not had an Atari since I the Tramiels destryed the company and I moved to Apple - I still look in here periodically to see if anything is happening - what happened to the Hades and the other Atari type thingies that were being produced in Europe.

Atari was a great machine for the day - can't help but wonder what it would have become if things had been different

Hi,

I am glad you still have your Atari stuff.

Do you plan on using it in the future, or would you be interested in
selling or trading some of your Atari Items?

I could use a good Mono and Color monitor and a MegaSTE.
Maybe we could work out sometype of deal for some or all of it,
if you are interested.

I'd be really interested in the MegaSTe, Does it have a internal
Hard Drive?
Any upgrade boards in it?

I don't know much about the PS3000, Is that a Color VGA made
by Atari?

I am looking for 3rd party hardware and software for the STs-Falcons
too. Things like graphics cards, Digitisers, Samplers and odd bits of
hardware and software. TOS Upgrades/Switchers, CPU upgrades and
Speed boards.

BTW, did you ever have a CDROM drive connected to any of your
Ataris?

If you plan on keeping your Ataris, I do have some hardware and software
that you might be interested in when you get a system setup.

Do let me know if you are interested in selling/trading some or all of it.

And if there is any Atari Items that you are looking for, I may be able to
help you with that. I have alot of different stuff.

You can e-mail me at phantomm@bellsouth.net or phantomm@suddenlink.net

Thanks,
Barry

That's really kind of you to suggest users to report directly.
I hope not to importunate if I do. I'm always looking forward
to know about projects you're developing. That helps a lot !

Wow, I can't imagine going 3 *days* without using my Atari's, let alone 3
years!

I've got my highly modified Falcon, Modded Mega ST that runs my BBS, and
now the STacy I'm working on. All of these get -daily- usage. I guess my
Mega STe and 800XL get the least use, but they are still used weekly. :)

Still great machines for me each day. :)

But I'm with ya, and I guess all of us will always wonder about the "what ifs", if Atari had done things differently, had listened to the users and developers...

Barry, I'm not sure about hard numbers - but I know there is still quite a
bit of traffic at some of the more popular Atari websites, like AtariAge
and Atari Forums.

Still some life left in the old dog, my BBS is getting about 40-50 calls
each month. :)

Well, that's not bad. I think we may see more BBSs appearing in the
future. With the Net being the new Phone Line.

With things being the way they are, looks like the old may end up
becoming new again with some technology.

I'm still active. Over christmas I started to delve into major changes
into GEM instant messenger. I really got far and really improved it but
I ran into a major roadblock. The libfaim that I use doesn't support
the buddy icon server protocol which is required by most clients these
days. I've started to make said changes but.. yeah... effort.
Though it is basically quiet, still in the planning stages and not
definitely or moving (read: extremely vaporware) there is some movement
behind coldfire hardware again. I myself have most of what I need to get my
coldfire board running. I still need to get an ethernec but it seems
nobody is selling them. I also think they're not worth $75 or whatever
people keep wanting to charge for them so I'm thinking about produing my
own batch but within the files there are not suitable files to send to a
PCB house :(

I sued to use mine everyday, and logged many an housr with BBS's around the
country. But after working oh so many years ago at a job reparing PC's at a
place called Incredible Universe, the working for Bell and Howell and CompUSA
I basically moved on. Hard to resist the PC urge when i could get items at
coast from many of my places of employment. So now , its a matter of space and
time. Back then my wife and I didnt have 3 sons, all getting into the teenage
years now. I have way to many concoles and i need to spend my time with the
kids and not my game systems or Ataris or PC's now for that matter.

I will brush off the dust soon and relive the fun but i can guarantee now that
probalbly half the disks might not work anymore, and no online useage for me.

If anyone wants some of the stuff from the old Stornmbringer BBS, software
that is, i can dump it to CD or DVD for a small cost for postage.

Hi, I'm Ben Smith here in Portland, Oregon USA! Proprietor of Bravo Sierra Computers! Occupying a unique niche in the Atari World! Most Atari Dealers sell NEW, I also sell Used Atari Goods! Not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you wont find at Swap Meets, Thrift Stores or Auction Sites! And I sell for less! Unlike those remaining anonymous! I test Goods before I sell them. Not only can I sell you some Great New stuff! I can also sell you hard to find 2nd Hand Goods, because I'm the guy people goto to give Ataris a New Home! Saving Orphaned Atari's from Oblivion!Goto http://BensCatalogs.Atari.org or (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari 8 Bit and ST Games/Software, Hardware/Accessories and Books/References!

Being a moderator of a 1000+ members forum myself I'm afraid I have to disagree. Spam really is a big problem in forums. Not due to users posting nonsense but actually spam bots also crawl forums and post all kinds of spam messages there - including posts with explicit sexual images!

The solution we found for our forum is that we require users to validate. This is a new user's posts are not shown to the public but only to us moderators. We than approve or delete those invisible posts and based upon that end a user's validation period or deactivate his account.

PS: Me too, I'm still a regular ATARI user. I'm mainly using my Falcon for Cubase MIDI work. :)

Yours sincerely,
Dennis Schulmeister

I have a couple of Atari's. 800XL (missing some cables) and 1040st.
they work but need some things made, mouse fixed. While the 800
doesn't matter to me, i'm still planning on getting the 1040 up and
running good. Need to finish the amiga monitor cable for it.

I'm a old hand at IRC, been there, done that.
#atariscne and some of the other ones,

I got some help there with problems in real time. But not everyone is
on-line at the same time. When using a News Group, the posting can be read
by someone who may need to at a later time.

I'm not knocking any area where we can freely express our ideas and exchange
info.

As for Sinclop, I've not seen anything posted from that Bot program in
sometime.
Unless you are refering to anyone who happens to use a PC as a Sinclop.

Hey Mark,

Good to hear from you.
I am glad you are working on that stuff.
If you get the files needed to produce a batch, do put me down for at least
one of them.

BTW, in what format do the files have to be in, in order to be used by a PCB
house?

Reason I ask, I have some projects, mostly just hardware and would like to
go thru the process of getting some of them made. But need some guidance
on how to go about it.
Maybe if you have some extra time, you could post or e-mail me how to
get a Atari hardware project made/re-produced.

To be honest I don't know. I think there are gerber files and drill files that are common amongst them all. I think from a scooter PCB file or an eagle file you can generate the gerber and drill files. I will be experimenting a bit with this.
Thanks,
Mark

Well, I'm still here, although I don't visit CSAST much anymore. When I got DSL about a year ago I stopped using my Falcon for Internet work, and most new documents are being done on my Macs. However, I still print older documents on the Falcon from time to time, use my SCSI scanner and SCANX often, and play the occasional game of Railroad Tycoon. Right now I'm visiting because I'm looking for documentation on Mint. It's time to try installing it on my CT60, which arose from the dead a few hours ago. (Still don't know what I did, but it's working.)

Glad you're all still here.

Galen

# 4028. Atari Falcon Tech Info_

Newsgroup: comp.sys.atari.st
Date: 2009-01-31 05:08:57 UTC
From: phantomm_1 <phantomm@suddenlink.net>

Source record: 2646

I've just rebuilt a Falcon 030 and have been looking over some
of the Modifications and Upgrades that one could get for it.
I left the motherboard in the factory condition.
It has a FPU, 14megs, TOS 4.04, Expose' Digitiser, 2.5 IDE Hard
Disk. The motherboard has no past modifications.

I'm looking at increasing the BUS Speed if possible without doing
a major upgrade involving alot of wires or replacing the CPU.

Have some Questions, for the most part they have to do with a
Stock Factory Falcon with TOS 4.04. No other Software
involved/installed except for the original Disk Software from
Atari. Such as the Control Panel, GDOS and etc.

What hardware on the motherboard is considered the actual Bus?

Where does it actually start and to what parts/chips does it branch out to
if it does branch out?

The AES
----------
On a Stock Falcon using TOS 4.04 what does the AES actually mean/do?

NVRAM
----------
I remember alot of discussion over the NVRAM.
To my knowledge, the clock which keeps the date/time is located
in the NVRAM Chip.
If so, can one remove the Top of the Chip and replace the battery?
And what does the Battery look like, is it the Top part of the chip or
some type of watch battery??

Does this battery also keep the NVRAM settings when the machine is
OFF?

Does the NVRAM have anything to do with the Factory Control Panel
software or the Newdesk.INF file?

Are there any other things that the NVRAM does that could cause
trouble if the battery is bad/weak?

I remember a collection of Falcon modifications and fixes that were in a
.ZIP
format. Really well done. I think it created by someone in Germany and may
have been called DOITF030. Anyone know if this is still available?

Any help with the above is much appreciated.
Any suggestions on a good solid BUS Upgrade or other

modifications for a Stock Falcon?

I've been looking at PCBoard Designer by Abacus Software.
It's abit old, but if a PCB House can use the Printout that it does
then that will be half the battle.

Correct. It also holds some other settings.

> If so, can one remove the Top of the Chip and replace the battery?

Only certain variants of the chip :-(

> And what does the Battery look like, is it the Top part of the chip or
> some type of watch battery??

Some type of watch battery. Chips where you can lift the top can have
an external battery fitted, commonly a CR3023 in an external holder.
It'll be fairly obvious if you can lift the top, but be careful if
you're just prodding about due to the oscillator crystal just inside.

> Does this battery also keep the NVRAM settings when the machine is
> OFF?

Yes.

> Does the NVRAM have anything to do with the Factory Control Panel
> software or the Newdesk.INF file?

Settings that must be retained across power cycles that aren't held in
the .INF file.

> Are there any other things that the NVRAM does that could cause
> trouble if the battery is bad/weak?

Usually it's the failure to hold time settings that give you the clue.

Replacing the chip is a fairly easy job, but there is one pin that is
hard to unsolder because it's connected to what seems like a large
copper plane on an inner PCB layer. You will probably want to cut the
chip free from its pins, as close to the chip as possible so that you
have something to grip as you unsolder each pin.

Much appreciated.

Looks like I have a NVRAM chip or battery to replace.
I have a couple of motherboards for parts, not sure if the NVRAMs on them
are any better.

From memory, mine, all the NVRAM chips that I have look about the same.
They are rather Tall, and look like they have a long rectangle block on top
with a line between it and the bottom part of the Chip.
Would this be the one with the replaceable battery?
Doesn't it require cutting with something like a Dremel tool or sharp knife
to get it apart?

I'd like to do the battery fix, if this can be done on this type.

I'd bet money on it. I just replaced one of mine and my towered CT2
Falcon needs doing too. The best solution is desolder and fit a socket,
then fit a new chip.

Give it a try on one of your spare boards and see if you can do it
without damaging anything.

Mark

Because I'm a klutz at soldering anything so fine as what seems to be on the Falcons motherboard, and I didn't want to ruin anything, I had this done by Alex Yu at ATY Computers, here in the US. Parts came from Brad Coda at Best Electronics.

Now, if the clock goes dead on my Falcon again, I can replace it myself. :)

If you're saying what I'm thinking, I wouldn't want to recycle NVRAM
chips from old boards. The battery lies dormant until you write to it
(ie fit the chip, then use a utility to set it up). Then it continues
to power the chip until it's exhausted.

> From memory, mine, all the NVRAM chips that I have look about the same.
> They are rather Tall, and look like they have a long rectangle block on top

Correct.

> Would this be the one with the replaceable battery?
> Doesn't it require cutting with something like a Dremel tool or sharp knife
> to get it apart?

No need for such action - the ones I'm on about have a softish plastic
top that is easy to lever off. I didn't think to try such drastic
action on the two I replaced recently, which did not have such "lids".

>
> I'd like to do the battery fix, if this can be done on this type.

It's the easist way forward IMHO. BTW, if you do decide to fit a
socket, you must be sure that you can get it and the NVRAM chip to
still fit under the keyboard.

Wow, good thinking on that part Derryck - I never considered it because I
have my Falcon recased in a Wizztronics rack mount.

If you've got the original case, it would be something to consider.

I agree - I just got mine done by Derryck, who posted an earlier
comment here. Note that if you want to keep the use of the
original shielding that fits under the keyboard, you will have to
cut a hole in it if you put the clock chip in a socket (highly
recommended if you need to replace it for a flat battery again in
the future, provided you keep it that long!); it's not difficult
with a Dremmel-type tool using a grinding disk. I even managed to
cut one side of the rectangular hole with a Stanley knife, though
it was hard work and took a looooong time :-(

Regards, /Peter/

The battery is replaceable on all variants - the amount of cutting and the
layout of the wires in the potting material may differ.

Note that both the lithium battery and the crystal for the RTC are in the
upper part of the module - you need to disconnect the old battery (at least
one wire), but keep the crystal connected.

On the modules where the "backpack" is only connected at the two short
sides, with a gap between the RTC case and the backpack, you can cut the
backpack in half and remove the half with the battery - an example (MK48T02
from a SUN SparcStation, not the exact type used in the Falcon):
http://www.ccac.rwth-aachen.de/~michaels/images/nvram1.jpg
http://www.ccac.rwth-aachen.de/~michaels/images/nvram2.jpg
http://www.ccac.rwth-aachen.de/~michaels/images/nvram3.jpg

AFAIR, on the fully potted Dallas variants, the missing bottom pins are bend
up to connect to the crystal and battery - comparing the pinouts of the
original MC146818A and the DS1287 should give a clue. Hm - googling for the
pinouts, it seems the MCA PS/2-PC guys had the same problem and Peter Wendt
documented the procedure:

http://www.mcamafia.de/mcapage0/dsrework.htm

>Doesn't it require cutting with something like a Dremel tool or sharp knife
>to get it apart?

Dremel might work, knife probably not, the plastic is quite hard. When
working with a Dremel, be careful not to leave metal dust inside the
machine.

cu

Fascinating. I've used the technique of milling away the potting
material in the past, to repair a broken-off pin. Broke it whilst
installing a mod which involved cutting said pin and soldering a wire
to it :-)

Body handling: HTML body converted to readable text

The ATARI bookmarks page was
updated. The goal consists in valid links, even if it corresponds to
sometimes dated information. Part of those bookmarks persist since the
creation of the WEB site, back in 1996.

The interest with these numerous bookmarks, there's more than 600, is to
constitute an ATARI uptodate and dedicated search engine of the online
scene. It is a service provided by Google Co-op. The base of this engine
is a collection composed from time to time. It has now become quite
consistent.

This is an experience of WEB 2.0. Even if I'm responsible for
its creation, *ATARI Search Engine* can possibly be integrated by
webmasters adding the HTML code

Have a good ATARI WEB Surfing =)

Hi,

I have a older version of MagiC, didn't know it was still being supported.
Is there a English Site for Upgrades?

It would be good to have a list of known supported Atari ST-Falcon Software.
Posted in some of the Atari NewsGroups, it would remind some of us that
there are still some software thats being supported or can still be bought
new.
I have always bought the software that I use.

# 4060. Mega ST, Ste and hard drives.

Newsgroup: comp.sys.atari.st
Date: 2009-02-06 20:14:23 UTC
From: philicorda <philicordaNOSPPPAAAAAM@NOSPAM.ntlworld.com>
Message-ID: <zS0jl.20110$E93.6256@newsfe11.ams2>
Source record: 2478

Hello.

I have a new (to me :) Mega4, which came with an SH205 hard drive. I also have my previous STe.

When I plug the sh205 into the Mega, and reboot, it does not see it. It works fine with the STe without any configuration and seems to find a driver on the hard drive.

So, do I need a special driver for the Mega? It seems odd that it does not see the drive.

I'd like to use the Mega as it has more memory. Unfortunately, the floppy is dead too. So, can I swap the STe floppy for the Mega one? Also, can I take the memory from the Mega and put it in the STe?

Any pointers appreciated.

You did try starting it from a "cold" start (everything off, then HD on
first, then ST) as well, right? With no floppy in the floppy drive, you'll
also have to wait longer for a bootup.

> So, do I need a special driver for the Mega? It seems odd that it does
> not see the drive.

Seems odd and suspicious to me too. I'd hook the SH205 to the Mega ST and
boot up with the hard drive software on a floppy in the floppy drive and
see what it reports.

> I'd like to use the Mega as it has more memory. Unfortunately, the floppy
> is dead too. So, can I swap the STe floppy for the Mega one? Also, can I
> take the memory from the Mega and put it in the STe?

Oh, the floppy is dead - hmm, then you can't boot up with your hard drive
software. You'll need to get the floppy working to do that - that software
can tell you a lot more about what is going on.

Depending on the drive "face" you can swap them out - but the Atari drives
came with large eject buttons, small eject buttons, etc - you should be
able to look at it and see if it will fit or not.

I don't think, unless its some 3rd party/aftermarket board in the Mega ST,
that you can swap memory - the STe uses SIMMs.

> Any pointers appreciated.

There'll be others answer this thread - help is coming! :)

Hope this helps in the meantime.

What does "seems to find" mean precisely? Does it boot and can you
access it as drive C: (perhaps after creating a desktop icon for it
manually)?

If not, you might try running AHDI 6.061 from your disk drive (after
replacing it) and see if the drive is accessible afterwards. You also
may want to mark bad sectors with HDX - as used ST506 MFM drives that
have not been parked prior to moving will most likely have a number of
bad sectors. And you may also want a program to park the drive yourself
so you can move it.

I bundled AHDI with some other free hard drive tools (esp. the last
version of HDX, as at least one prior version I tried was unable to
format and partition the SH205) at <http://www.dilgar.de/ahdi6061.zip>.

With HINSTALL you can then make the drive bootable. This should also
work with the Mega ST, as the drive is a small one and even a single 20
meg partition is far less than the maximum of 256 megs for a TOS 1.02
compatible partition.

> So, do I need a special driver for the Mega? It seems odd that it does
> not see the drive.

Nope, they all use the same software. Yet, TOS 1.02 has some bugs that
were fixed with 1.04. i'd recommend this TOS as the lowest recommendable
version for hard drive use.

> I'd like to use the Mega as it has more memory.

Any STe has four 30-pin SIMM sockets and can easily be upgraded to 4 megs.

> Unfortunately, the floppy
> is dead too. So, can I swap the STe floppy for the Mega one?

Yes, if the bezel fits. No, if not.

> Also, can I
> take the memory from the Mega and put it in the STe?

No, the memory of the Mega ST consists of RAM chips soldered to the mainboard (or perhaps socketed), while the STe requires 30-pin SIMMs. You can take the SIMMs of any old (e.g. a 80486 one) PC though if they are 1 meg max. each - those should be some cents at eBay. Just be sure that you have four of them or - if you can only find two - use the first and third SIMM socket and leave the other two empty (there is a small patch that allows to access 2.5 megs with 2 1 meg and 2 256 K SIMMs, but I don't even consider this worth the hassle).

Except for the keyboard (the STe keyboards are from Mitsumi, the Mega ST keyboards from Cherry) and the lack of a battery-powered clock, I consider the STe the much nicer machine, sadly the enhancements like the PCM stereo sound, the hardware scrolling and the additional joypad ports (compatible with the Jaguar) etc. were used by only a few dozen commercial games because Atari did not discontinue the STfm models when they introduced the STe, so that many buyers bought the "cheaper" machine, but some of these (like Obsession Pinball) really show that this computer is much better than it's predecessors.

Not sure, but I am still in the game. I use my Falcon for a number of things (DTP, home finance, web browsing, etc). A number of my Atari buddies have moved on to the PC. There are still users out there who we probably do not know about and many that we do. There also dealers we can rely on to get software and fix our hardware. Hey, I know the interest is still out there. I cannot count the number of times I have lost Atari items on Ebay.

Whilst things are basically the same, the way auto start works on the MEGA and the STE are somewhat differently. I can't remember the details but this could be the difference. For the MEGA you will need one of the auto utils to run a shell or whatever.

> So, do I need a special driver for the Mega? It seems odd that it does

Much easier to upgrade the STE but you have of course an integrated keyboard.

ASH are/were the distributors; their web site is still up, but whether
there is anyone there is a matter of conjecture :-)

Last I heard, they had someone who could speak English, but you/anyone
won't have a problem finding someone to translate.

As for an English version, all the necessary resource files are on my
web site. There might even be a patch file to change the remaining
German into English.

I'm occasionally using MagiCMacX on my Mac, which I purchased from Ulf Dunkel.

Exactly - just go to ebay and search on Atari st - if the return looks
low, then change the parameter from auctions to buy it now - Atari ST
returned 381 hits just now. :D

The floppy face on the 1040STe is different to the Mega. Luckily I also
got given an 520STfm, which has the same bezel. I don't know if the 520's
drive is working yet though.

It comes up with four partitions on the desktop automatically and an icon
for a RAM disk, which does not seem to do anything.

I think the hard drive may well be a little ill. It is however working on
the Mega now after turning them on in the right order!

It's been partitioned into 4 drives (C,D,E,F) and when I click on C it
says 'Data on disk in drive C may be damaged. You must use the right kind
of floppy disk and connect your hard drive properly.' (CANCEL/RETRY).

If I click cancel then I do get a folder window, and can start programs.
Some will not work though, and writing anything to the disk causes the
'may be damaged' error message too.

On Boot, the screen says something like:

AHDI 4.02

Gdos 1.1

Downloaded it. Cheers.

I think the drive is 20MB.

I think I will reformat it into two partitions, as it's acting a little
funny.

So... the HDX utility is for formatting and checking bad blocks, then you
run HINSTALL to make it bootable. Anything else I need to know?

I am going to use this machine for Cubase and a Zcode interpreter, so the
Mega should be fine. (20MB is a lot of space for midi files!)
The clock, more ram and nicer keyboard should be handy for this.

I also found my extra midi port, that plugs into the modem socket.
Lost the drivers for it though. :(
I believe it's a 'plus16', and may work with the plus48 or pls48 drivers
in Cubase. There are no markings on it.
It's been a long time since I used it last!

The "40 folder problem" springs to mind. Put the FOLDRXXX.PRG into the
AUTO folder of drive C: after renaming it to e.g. "FOLDR100.PRG" - this
is especially necessary for your Mega ST!

SHIPACC.PRG allows you to park your hard drive - runs as both ACC and PRG.

AHDICONF is of some use if you want to tweak AHDI a little.

CHKDISK3 is a powerful tool for hard drive sector editing,
defragmentation, etc. but the dark side is strong within this one, i.e.
you can easily delete data with the more advanced functions of this program.

Server still up-and-running. Who can make me a happy guy?

Thanks a lot for your time and effort. Much appreciated!

Happy computing (since 1985 on my AtariST, now also having an AtariSTe
4 MB with ICD-Linked harddisk drive 50 MB :)) )!

After there are some problems, if you reoganise a database, comes here a new version.

The archiv contain also some new desktop icons from Sascha Uhlig.

Are Atari 2600 joysticks compatible with the Falcon? I have a jagpad
for the Falcon's enhanced game ports, but I need a couple of joysticks
for the regular game ports....not all games utilize the jagpad.

Thanks

I still have my Mega STE set up but it's been many months since I used it. I used to use it for text email and Usenet when I was on dial-up, but now that I have broadband I'd need ethernet connectivity. My provider doesn't have dial-up backup, and I can't justify the expense of another service just for nostalgia - particularly during these economic times.

I also have a complete 320K 130XE system that worked just great the last time I dug that out - probably six months ago. Those old 5-inch floppies have a surprising lifespan, and those old games have a charm missing from today's efforts.

I've moved on to Linux almost exclusively these days. I have a couple of apps for Windows that I still use, but that's almost as rare as using my Atari anymore.

I was online from my Falcon at the weekend, chatting on IRC. I think
I need to do the NVRAM battery thing though. For me, it's a matter of
time and utility - I do like getting things running but unless I have
something that I need to use a particular computer for I tend to go
with the convenience of my laptop.

Get an EtherNEC - then you can still hook up to your LAN, and do e-mail,
newsgroups, etc... :)

Oops, sorry - didn't mean to make this 2 replies but I re-read this part
and boy, do I agree! The older games do have something special about them.
Don't get me wrong, I'm as big a fan of the latest/newest visual/audio
overload game release as anyone...(and play Guild Wars to death),but...
DungeonMaster, Bards Tale, Ultima 3/4/5, and so many more.... Oh my. :D

2600er ones should work. Avoid the 7800 Proline controllers as they seem to
be incompatible with the IKBD of the ST/TT/Falcon.

Best is ofcourse a good old Competition Pro 5000 :)

cheers,
Matthias

To which type of sticks do you refer? Ataris ones are ofcourse not made
anymore but the Competition Pro is available as remake jyostick, both with
USB and DB9 plugs (for ST use yo uwill need the latter).
It is distributed by Speedlink but I cannot tell about special vendors.
Google aroudn a bit, IIRC Vesalia in Germany sells them.

cheers,
Matthias

So, a couple of things come to mind -one, the seller may be too
cheap to pay
the reserve price fee, and two, if you don't like the conditions of
his listing, you
have the right to ignore the auction and keep looking. This oerson
might not
be a class acr type of a seller, but it's his item to sell as he so
chooses as long
as he follows the rules. When it doesn't sell, and he re-lists it a
few times, he
might get the idea he needs to determine a fair starting price (fair,
as far as he's
concerned, not a buyer's view).

I agree with that.

One of the problems with online Auctions is the seller doesn't really know
what the
buyer can aford.

If I was on a desert and needed water and had $2.00. I don't think it's
right for someone
to charge me $2.00 for each drop however.

Last year I had a chance to even buy another Hades060 on Ebay. I passed it up
because the seller was not sure it worked anymore and he was selling it for
about $2000.

Hello,

I bought a Linksys Wireless modem so that I could run my two Xboxs. It all worked fine, so I decided to see if it would work with the Falcon. I was very happy that it did. I used a Linksys-B Gaming Adapter. It just plugs into any computer/gaming console that has an EtherNet connector. I just plugged the adapter inot the NEC2000 and it worked. Nice to know...

Hi Edward. So theoretically, I could take the LinkSys-B Gaming Adaptor,
plug it into my EtherNEC, then into my STacy, and have a portable wireless
Atari?

That would be way cool. Thanks.

Wow - steep price. But then, just look at Falcon, Mega STe, STacy, and TT
prices lately on Ebay.

Our fav machines have held their value very well indeed! :)

I don't think it's even a matter of not knowing what the buyer can
afford.
Rather, it's either a matter of knowing the value of an item or
thinking that
the item is "valuable" and commands a high(er) starting price. And,
the
seller may be hoping that a potential buyer has no clue as to the

item's
worth, and bids unknowingly.

As to your water example - if you wanted that water badly enough, you might just bid your money because you were worried another opportunity for
water might not happen anytime soon!

Depends on the voltage. My understanding from a quick look at the cct is
that it disables the chips ability to recharge. If its 3.3v then the
answer is yes.

Mark

I don't know this seller, either. But, I am an eBay user - seller &
buyer - and
experience tells me that many sellers and buyers have a disillusioned
view
of the "value" of various items. I've seen incredible final sales
bargains, and
outrageous final sale prices for "cheap stuff".

Hi Lonny! Okay, thanks for the info. My workplace runs a wireless "guest" network, looks like I'll be seeing if I can access that.

If I can, I'll be telling the IT director there his network is so antiquated that I can access it with a 20 year old Atari laptop... <evil laugh> (its okay - we're friends)... :)

A new site about Atari TT has came to being. All interested people are invited. We aim at gathering informations (as much as we can find) about 32-bit Ataris and also we want to contact TT-users with those who still make various extensions to TTs. You can join the online list and help us with developing the site. We also look for someone who can help with making German version of it.

The link to the site is: http://www.ataritt030.info

Really cool and useful data base that (I hope) will grow!

I liked the Atarians list (I joined!) and the links that everyone can add.

I will add a link to your site from mine.

Guillaume.

I was going to trade a Mega4 ST with upgraded Keyboard (megaClick) for
an 800xl That Ben still has listed about 2 or 3 years ago.
So not sure whats up with that.

I would be carefull with him, His site says how he Checks everything
complete, but all his ST computers
Say AS IS , Untested ect... Which I think means there not working..

Noticed that too, and it does seem kind of odd.

On the other hand, I've bought software from him before,
with no problems at all.

I am not involved in making money from this, but I just found out who, in the USA, bought up Atari's Hooded Pullover Jacket overstock, from about 7 years ago. I had one, it was stolen, and being a large person, or at least large enough, I have replaced it.

James Stylin and one hired help are stylinonline.com. He makes a market in shirts and caps and belt buckles of interest to players of modern computer games, and one of interest to Atari users. It is thicker than the usual pullover, in dark blue, with light blue Atari Logos on chest and sleeve, and not only that, are on sale, to get rid of them.

My first one came from a fellow whose logon name was Small Sam. At his pretty big height, his was too short for him, and he sold it to me on E-Bay. It got stolen by the housekeeping staff at a hotel, and I have replaced the stolen one.

They have size Large only, so if you are also large enough, we can both wear one and recognize each other that way.

If anyone needs help in getting on of those things to Singapore, which is on the other side of my world, I will help. They look really nice.

Jim

Source record: 2447

Bonsoir

Download on my webpage or directly in the folder
http://rajah.atari.org/files/ -> kkcmd14b_uk.zip (160KB)

Changes in this Total Commander clone:
-fix: if extension, bad spaces removed in new empty file or folder
-fix: if .ZIP opened, the window contents (but not the .ZIP file) was cleared,
when file deletion in the other window
-fix: size of dragbox (copy or move files) is more adapted if more than one
selected items
-fix: didn't keep date when unzipping (if option 'keep date' was selected)
+add: .MSA and .ST files in command line (.ZIP was already managed)
+add: VA_START protocol for .MSA .ST and .ZIP files

Also Litchi was updated with the 'dragbox' fix.

Voilï¿½.

Yes that is true. I picked another Lynksys wireless adapter, the LN-Gaming
adapter and it worked also.

That is true. You need a PC to setup the B abd N Lynksys adapter. However if
you do not have you SSID setup and you do not have a WEP password, the B-
gaming adapter will work right out of the box with no setup.

It would be helpful if you described the bezel more precisely, since
there were at least two different floppies built into STs and Mega STs:
Chinon (large eject button beneath the disk slot) and Epson (small eject
button on the right side).

In that case, it will be insecure. Setting up a secure WLAN connection
*requires* you to use WPA and setup the keys on both ends.

Hmm, any chance they have a command line setup? Would be nice if you could
use an emulator to set it - thus breaking any reliance on Windows
whatsoever (personal committment of mine). :)

Hi Michael - that brings up a question. The hospital where I work at maintains a wireless network, a "guest" account so that patients can log into it from their rooms with a laptop. No password/keys are needed.

How do they secure that? There is a disclaimer at the first logon, saying that basically everything that happens is the users responsibility. Guess that covers it, huh? :)

But...going by what you and Edward have said, I should be able to use the "B" device, via an EtherNEC, with my STacy, and logon to that guest account. I've done it with my Linux laptop - no problems.

Thanks.

Whoah. They are still in business? I thought the French mag was the only
one left - the one I've been giving away on my BBS - and its a very small
mag - not large at all.

Thanks.

IIRC, they also produce it in English as well, but you have to get it
through 16/32 Systems.

It is not secure at all - anyone can connect, and all data is transmitted unencrypted over the air, so anyone with a laptop can easily sniff everything. When using such a setup, you should make sure that critical data (like passwords you enter on some website) are encrypted by the client.

On a private setup, this is probably not what you want - anyone can connect to your access point and (ab)use your internet connection, and anyone has direct access to all your machines just like he plugged a cable directly into your network - and when you use protocols that do not encrypt the passwords, like ftp/telnet, you also broadcast those in cleartext to anyone listening.

cu
Michael

Interesting reading....

Can the EtherNEC, NETUS-Bee, or a similar device be bought now?

I have a nice STacy and a few Falcons that could use one or two of them.

If someone has a spare for sale/trade, then do get in touch with me, From
what I've read
here I would need the Linksys-B Adapter too.

I use my Atari's all the time, it would be nice to bring my Ataris Net stuff
I use up to speed
without going thru another system. 8-)

Also, if anyone has a spare VME Ethernet board for my Mega STE, I'd be interested in
working out some sort of deal for it.

I can be reached at: phantomm@suddenlink.net

Greetings,

Years ago, I remember Contests for the best Computer Animation, best Computer
Audio/Music and etc. Where users of all brands of Computers entered their work for a shot
at being the best.

Do these Contests still exist, and if so, where are some of the best ones to get involved in?

Also, what is the latest thing in Computer Graphics and Animation if anyone knows?

I and a few people I know enjoy using Atari ST-Falcon for graphics and animation.
We would like to see whats considered to be the "in" thing and try to better it.
Where would we go to find the best graphics and animation being done today?

# 4160. VME BUS adapter for MSTE/TT

Newsgroup: comp.sys.atari.st
Date: 2009-02-25 05:34:36 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <49a4d872$0$5454$bbae4d71@news.suddenlink.net>
Source record: 2328

Greetings,

Are there any known VME Bus adapters that will work on the Atari MSTE/TT
that
will allow more than one VME card to be used/connected at the same time?

Also, has anyone tried using any other cards besides the Graphics Card with
the VME
Bus version of the NOVA Graphics Card on a MSTE or TT?

# 4161. USB projects for Atari ST-Falcon

Newsgroup: comp.sys.atari.st
Date: 2009-02-25 05:54:18 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <49a4dd10$0$5479$bbae4d71@news.suddenlink.net>
Source record: 2329

Where can I find technical info for a beginner who wants to do some
USB projects for the Atari ST-Falcon?

A easy step by step USB project would be good for him to start with.
One that doesn't require coding from scratch. Or requires no software
at all. To get him started. Then he may learn enough to move on to more
advanced projects of his own making.

He would be interested in some sort of USB connector for the Falcon.
And if it would work on earlier Ataris then all the better.

Maybe using the cartridge port, or parallel port. How about the DSP port?

Could the enhanced Joystick ports be used for a USB Connector?

Any info is appreciated, send to phantomm@suddenlink.net

# 4162. Atari ST Software for SALE--__--

Newsgroup: comp.sys.atari.st
Date: 2009-02-25 07:13:02 UTC

Hmmm...

Well I took your advice at went to Ebay. I found some software here that
they
have on there and listed it here with a better price.

Have Fun,

# 4164. TT and a background image

Newsgroup: comp.sys.atari.st

Source record: 2332

Coucou,

Here is my colored desktop under plain TOS:

http://pagesperso-orange.fr/gtello/colortt_e.htm

I started with the work of Noud van Kruysbergen in DEGADESK (that worked on a ST in ST High long time ago...) to add the ability of putting a desktop image on the TT.

I can swap from my 6 possible backgrounds using directly the menu entry of the GEM desktop.

Guillaume.

I like the content - there's some good STuff in there, time to time.

It's been awhile since I've seen a new issue though - have to check on that. I had been giving a 3 mag subscription away on my BBS, to one lucky caller each month, but for the last few months, it's been the same mags coming from Nick at 16/32. I'll have to e-mail him and see if he knows anything about their schedule.

Yes - I remember this has been done by simply connecting a second VME
connector in parallel. Keep the connections as short as possible, and set
both cards to different address & interrupt settings. For cards which
require a big amount of memory space (like a graphics card), finding enough
address spcce may be difficult in a MSTE, though.

As long as you are refering to complete games in the full-sized
first-release box, amon others

"Nitro" by Psygnosis
"Magic Boy" by Blue Turtle
"Oids" by FTL
"Wanderer" by Pyramide
"Gauntlet" by U.S. Gold
"Brataccas" by Psygnosis
"Hunter" by Activision
"Sundog: Frozen Legacy" by FTL
"Monster Business" by Eclipse
"Traders" by Digital Integration

seem to be rather rare, as are supposedly several other titles esp. from
very early and very late in the ST's commercial lifecycle.

Thorsten

Ok,

I have NITRO in a 3 game box set called MONSTER PACK Vol 1.
It includes Nitro, Shadow of the Beast 1, and Infestation. All original in
excellent condition.

Also have Wanderer, Original Disk(s), manual in nice box.

And Sundog "Frozen Legacy Original Disks and Manual (no box).

These are for sale, btw. Send offers to me at phantomm@suddenlink.net

I think I have Oids, but will have to check for it.

I came across some older games, not sure if they are Rare though.

ok...not sure I quite understand how to do this... I've not done alot of VME
stuff on Atari.
However, today I installed a NOVA Graphics Card into the VME Bus of my
4meg, TOS 2.06, MegaSTE which also has a Vortex 386SX installed.

For the moment, I have it connected to a MAG 17inch SVGA.
I'm quite suprised at how Fast it is, even though I'm not running NVDI or
Warp 9
yet! Looking at pictures in a 24Bit color mode is really nice on the ole
MSTE!!

Michael, when you say "connecting a second VME connector in parallel" are
you
talking about the Factory Connection inside the MSTE/TT? Or do you mean
something
like a board with a long connection that a card plugs into with 2 additional
34 pin
connectors?

I have a couple of boards with the long connectors that a card such as a
graphics card
plugs into. Each board also has a pair of connectors with 34 pins for Ribbon
Cables?

I was wondering if I could somehow use the above board along with the Nova
setup so
that I can add another type of card?

If so, is there any type of Ethernet or other cards that are supported with drivers that I could use
on such a setup for use with a Cable Modem for Fast Internet access with the MSTE?

If not, and I can use the board, what other cards are available or were made other than
graphics cards?

Any help with this is much appreciated.

This could work on the Mega STE with TOS 2.06 and your NOVA Board!

> btw, is MPlayer still being updated?

Yes but slowly and mostly for personal use.
These days I'm trying to make something like a Aranym compatibility
using clean VDI calls to display the images in 24 bits or 32 bits modes.
This won't be an optimized way of using M_Player, but it could help...
As M_Player can disassemble videos (images or sounds) and re-assemble
videos. So using a fast PC+Aranym could do the job better.

Guillaume.

USB is definitely not for beginners. And really, not for old Atari machines. I'm not saying that it is not possible, actually some things are already done. We have NET-USB adapter already made. Docs are available, as it went to open source project. What was the problem ? Lack of SW, drivers. So far, only mouse driver is made, and even it is not real USB, but PS2 mouse driver, as USB mouses usually use PS2 protocol.

Some notes: cartridge port is acceptable (NET-USB uses it). Joystick port is not good. Parallel port may serve, but is slow. Best would be DMA or direct ot CPU bus.

It does not matter *how* you connect the second connector, as long as you
keep the connections short (a few cm max.).

Looking for a 2 chip set of TOS 2.06 and or a TOS 2.06 switcher board.

Also interested in Ethernet hardware/software for ST-Falcon.

Will purchase and or trade Atari hardware/software.

Contact me at: phantomm@suddenlink.net

Barry, I might have an extra TOS 2.06 chip set - gimme a few days to look
for it - if I've got it, I'm not using it, so you can have it.

Hi again and again,

I go on working on the TOS3.06 desktop, I changed a bit the menu.
It looks like it's easy to do... But it requiered a long work
understanding how the AES does the thing.

http://pagesperso-orange.fr/gtello/colortt_e.htm

Guillaume.

# 4186. Wanted: Atari Mega ST4!

Newsgroup: comp.sys.atari.st
Date: 2009-03-02 07:38:23 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <alpine.DEB.2.00.0903012336150.25781@slate.spiritone.com>
Source record: 2354
Cross-posted to: comp.sys.atari.st,pdx.forsale

I'm Looking for an Atari Mega ST4. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. Preferably the 6 Chip TOS set as laid out on the MotherBoard. The important feature is this. The built-in floppy must be the Chinon. You can tell, the drive has an eject button centered under the floppy slot. The button is wide, short height & slanted on both the left & right side. This Chinon Drive is the Most Common ST Disk Drive! And the case needs to be unaltered, not cut up to replace a drive with an incompatible eject button. Please direct All replies via E-Mail to Atari@aracnet.com or call Ben anytime (503)256-9974. I need to keep this Within the U.S. as far as this Mega ST goes.

Why insist on a Mega ST4? Why not a Mega ST2 upgraded to 4 Megs?. Answer: I had a Mega 2 upgraded to 4 Megs. The upgrade failed & I don't want that again. I don't care if Jack Tramiel himself upgraded it and Guaranteed it. I want the Mega to come that way from the factory. I don't trust most other peoples tech work. I'd rather have the RAM put in at the Factory.

Atari 8 Bit and ST Games/Software, Hardware/Accessories and Books/References! FREE Catalogs @ http://BenSells.Atari.org or http://BensCatalogs.Atari.org or Catalogs Requested by E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST or Both! Or Call Ben anytime at (503)256-9974!

# 4187. AHCC v3.b2

Newsgroup: comp.sys.atari.st
Date: 2009-03-02 15:40:48 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <7de4$49abfe29$4dfbcd14$2875@news.chello.nl>

```
LS

There is a new version of AHCC available. (see sig)

Changes:
AHCC now detects and inhibits infinite recursions
during macro expansion. (v3.b1 crashed)

Fixes in relative path handling.
More flexible handling of shel_find result.
Built in macro __FILE__ changes '\' to '\\'.

Have fun.

Thanks for your work. I'll probably have a few remarks to tell you
about building my own software, if it's not disturbing your quietness.
I'm always so worried about miss-commenting the hard work of another
ATARI developer, because I'm one for so long. For 12 years now with
my Hades 60. I tested AHCC with <http://eureka.atari.org/miniPack.zip>
for the moment. Thanks for your good comments about it, and for ARAnyM.

Anyway, at first sight it look like a really good job, indeed.

Be sure I won't let the devels down, thanks to your support.

Best regards,

Hm, I am not sure what to think of this.

I am aware of the fact that compiler writing is a delicate job.
So I am prepared for the worst ;-)

It might be encouraging to know that I used AHCC for
compiling the Algol 68 interpreter of Marcel van der Veer

http://www.xs4all.nl/~jmvdveer/algol.html

resulting in a 600Kb binary that correctly ran
a few small Algol 68 programs.

So it shouldnt be that bad :-)

True, but it only takes a few minutes to set things up. Just remember to turn
off all firewalls or the computer will never see the adapter.

I admit it would be nice, but I do not think so. However I was able to access
my Cable modem's setup screen with my Hades060.

# 4207. Network help?

Newsgroup: comp.sys.atari.st
Date: 2009-03-08 16:12:40 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <gp0qpo$lrj$1@reader1.panix.com>
Source record: 2375

Somebody has done this before, probably, so I though I would ask first.

I want to run a serial link between a TT030 and a Stacy, and both of them
run some sort of TCP/IP link.

The complication here is that a TT030 has five serial ports, while other
things have just one. How does one set that up, using MiNTnet on the TT030
and STiNG on the Stacy?

If I figure this out before I am handed a working solution, I will of
course post it here, but I am hoping for the least work way of doing what
I need to do.

Jim

# 4208. [ANN] KKcmd 1.4B and Litchi 1.1H (fixes)

Newsgroup: comp.sys.atari.st
Date: 2009-03-08 19:34:06 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <49b41dad$0$21740$7a628cd7@news.club-internet.fr>
Source record: 2376

Bonsoir

Some fixes. Download on my homepage or directly in the folder
http://rajah.atari.org/files/
-> kkcmd14c_uk.zip
-> litchi11h_uk.zip

Common changes:
- trying to keep position inside window files list, after a dir or files manipulation
- better file selection if it was not yet selected (if no mouse movement, then selection and drag'n'drop, instead of grabbox for multi-selection)
- pop-ups sliders redraw problem, under XaAES: 1 pixel larger.

For Litchi:
- fixed redraw problem after selecting on file only with grabbox.

Merci ï¿½ O.Landemarre et JF.Lemaire

Hi Jim,

I'm in the processing of doing something similar myself.
Using a STacy, MSTE, Falcon.

I had some sucess with the MIDI ports,
The Midi software I was using was a older shareware program and all you need
is MIDI cables. I forget the name at the moment as I was trying a bunch of
MIDI
software out at the time. But I think it on the UMICH site.
MidiNet, MidiCom, something like that. I had no trouble with transfering
text in
real time. But ran into a problem with file transfer, I couldn't access the
drive
partitions on one machine from the other. I think I know what I did wrong,
and
will test it before I will go into it. But I think it was a simple mistake.
The program I used Runs as a ACC. and there is only 2 or 3 files in all.

If I understand what you are trying to do, it may work to use the MIDI ports
for a link
between the computers and then use STing to connect to the Net.

The problem with doing it all with Serial ports would be getting the TT to
use two
serial ports at the same time. If you want it all working at the same time.
I've a MSTE so it's somewhat similar situation as the TT.
I use STing on all my Ataris, except for STalker for BBS related.

One option may be to use a null modem link between the STacy and the TT
using
something like STalker while connected to the Net with STing on the TT with
another
port. I've not tried this myself yet, but headed that way.

The thing about MIDI however is that you can in theroy connect around 250+
Ataris
together at the same time. But may be to slow for your needs. Some say MIDI
transfer is
about like a floppy drive. However I have read that it's faster than that,
so I really don't
know about how fast it is with file transfer. I would think drive speed
would come into
play in either case.

I've not fully explored what STing can do, there is a STing Server. And
STing has
drivers for all the ports if I'm not mistaken. STing may actually be able
to do what you
want all by it's self. I've never gotten into using it with 2-3 ataris yet.
Another project to
look into. 8-)

If you get good results, do let me know and I'll do the same soon as I have
time to
work on it. Been doing some hardware work lately.

I'm Looking for an Atari Mega ST4. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. Preferably the 6 Chip TOS set as laid out on the MotherBoard. The important feature is this. The built-in floppy must be the Chinon. You can tell, the drive has an eject button centered under the floppy slot. The button is wide, short height & slanted on both the left & right side. This Chinon Drive is the Most Common ST Disk Drive! And the case needs to be unaltered, not cut up to replace a drive with an incompatible eject button. Please direct All replies via E-Mail to Atari@aracnet.com or call Ben anytime (503)256-9974. I need to keep this Within the U.S. as far as this Mega ST goes.

Why insist on a Mega ST4? Why not a Mega ST2 upgraded to 4 Megs?. Answer: I had a Mega 2 upgraded to 4 Megs. The upgrade failed & I don't want that again. I don't care if Jack Tramiel himself upgraded it and Guaranteed it. I want the Mega to come that way from the factory. I don't trust most other peoples tech work. I'd rather have the RAM put in at the Factory.

Atari 8 Bit and ST Games/Software, Hardware/Accessories and Books/References! Source record: 2382

Paul Quirk has created a new web forum for users of
classic computers. Go to http://retro-link.com to see the
opening message or to http://retro-link.com/smf/ to browse.
To sign up, send an e-mail to paul(at)retro-link.com

According to Paul, Retro-link.com will be different. This is
what he says --

"There will be a new site for enthusiasts of retro computers...
It will include other retro computer systems, as demand
warrants. That site will be called retro-link. The domain,
which has been registered, is at retro-link.com. I intend to
have it ready and open to the public this weekend.

The theme will be a mature, friendly, harassment-free
place where people can contribute as much or as little
as they wish. It will be a positive place where people can
post questions that have been asked a hundred times
without being insulted for doing so. It will be less of a
repository of information, and more of a social place to
gather and discuss...

The forum seems to be all-encompassing in its eight
categories -- General, 8-bit Commodores, Amiga, Atari,
Apple, Tandy/TRS-80, Vintage PC, and Others.

Truly,
Robert Bernardo
Fresno Commodore User Group

Just to make sure about this, can these still be
pre-ordered - or is ordering closed at this point?

Thanks.

Hi again,

I made some changes:

- colored menu bar
- custom system font (from a FNT file)
- custom sound at start (from a sound file)

http://pagesperso-orange.fr/gtello/colortt_e.htm

I think I'll stop here... for now!

Guillaume.

# 4222. End of Atari Auction, thanks.

Just wanted to say thanks to everyone who bought my Atari 8-bit and Atari ST-Falcon
Computers and related software, hardware, books and mags.

Just about everything was sold and what didn't was donated.

I do not have anything to do with Atari Computers anymore.

The Auction is over, so please do not e-mail about Atari related stuff any more.

Thanks and best of luck.
Barry

On a very serious note, years ago I sold all of my atari gear and I have since been attempting to acquire all of the things that I lost and then some. I am the cheapest man alive but I'll buy every falcon accessory and coldfire machine that comes along ;) I'm hooked for life I guess. Seriously getting rid of that gear was one of the worst decisions I've ever made.
Thanks,
Mark

I put this new diagram on the page (in the first third on the right),
it details my BOOT sequence on the TT with various systems installed
(TOS, MultiTOS, MyAES, MagiC, Geneva..)

http://pagesperso-orange.fr/gtello/tt_e.htm

# 4232. AHCC V3.b3

Newsgroup: comp.sys.atari.st
Date: 2009-03-19 12:57:00 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <7d5c7$49c2414a$4dfbcd14$13313@news.chello.nl>
Source record: 2400
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

LS

There is a new version available on my home page (see sig).

Changes since v3.b2:

Fixed a omission while expanding.
(K&R 2nd A12.3 dont replace at rescan.)
My solution of recursive macro expension yielded
false positives. So it is removed.
It might be necessary to completely redesign the
expansion mechanisms. The current implementation is a
Sozobon legacy. AHCC should work fine when you remove
all recursive definitions and usage in your sources.

A memory bug is killed.
A few minor bugs fixed.

The Pure C offsetof macro couldn't work in #if's
(again, Sozobon legacy).
Implemented __offsetof__ operator.

If your programs use offsetof in a #if conditional
and you do not use the stddef.h of AHCC,
you must copy the implementation of offsetof from stddef.h
in folder AINCLUDE to your own stddef.h.

Handling of # (stringify) and ## (token catenation)
same as Pure C (Not entirely ANSI).

I have looked everywere for NVDI 5 and connot find any one that sells it any more.
This includes ASH, European Shareware, Sytem Solutions and they dont have it anymore.
I have E-mailed the Authors of NVDI 5 from their homepage and the links are dead. I have called the 3 major atari dealer still left in the USA, B&C, Best and Video 61, they dont have it. I have spoken to via E-mail, all the European Atari Vendors that I can find on the web and they dont have it. See this is what I get for putting all my Atari computers in the closet for 10 plus years. I have NVDI 4 and just need the upgrade to 5.

Does any body know where to get it or can anybody help me?

Got my first Atari in in 1979, 800 with a 410 tape drive,Zaxxon on tape and a star raiders cartridge, I was hooked.

Got my Last Atari in 1992 I think, Falcon 030, and gota CT63 on order from Mr. Czuba.

Please anybody with info?????

Rob

Seriously, please, if you are a programmer and you're going to give up on development, just open source the darned thing so that our poor old machines can die of old age rather than the sudden disappearance of it's lifeblood, software. You're obviously not going to make any more money by discontinuing a program, so please pass along the benefits of your time hard spent to others in the form of open source software.

I remember not too many years ago people arguing that free open source software would kill off our platform. But look what's happening now: Magic is gone while Mint still exists. NVDI is gone while fVDI still exists. Jinnee and Thing are all but gone while Teradesk continues. TOS is gone while EmuTOS lives on. Open source brings just a little extra life to dying platforms. So release your software so it can live on a little longer rather than die the pathetic death of deletion, disk decay, or a trash can.

Source record: 2258

Hi Rob!

U>I have looked everywere for NVDI 5 and connot find any one that sells
U>it any more. This includes ASH,

Strange. On their homepage, it's still avaialble:

http://www.ashshop.de/ashshop/

from there, activate the link "Atari" in the top left box named "Kategorien".
Then click again on "Atari", and at the end of page 1 of the list there's the
NVDI 5 update from NVDI 3/4 (named NVDI 5 Update 1) at EUR 40. Click on the
"Bestellen" Button to the right to place it in the cart, then "Zur Kasse gehen"
in the left column (below "Einkaufswagen"). Then you've got to register, but I
haven't tested from there on.

With best regards
Ekkehard

# 4237. Help wanted for tests with Aranym

Newsgroup: comp.sys.atari.st
Date: 2009-03-24 10:09:18 UTC
From: Guillaume Tello <houten.van@orange.fr>
Message-ID: <49c8b0dc$0$12621$ba4acef3@news.orange.fr>
Source record: 2254

Hello,

I'm trying to adapt M_Player to Aranym. I can yet view some videos.
The problem comes from the DMA sound emulation, on long videos the sound
and images are not synchro. So I would like to know if the difference is
always the same... Because I did it in the past to adapt the synchro to
the Falcon or TT: both machines use approximations of the DMA STE
frequencies.

So i ran DMASOUND, a tool of mine, that tells you the actual dma sound
frequencies and I got:

STE Aranym (PC)
12517 12210
25033 24424
50066 48893

Can some of you do the same for me?

The DMASOUND tool is on the first line of this table:

http://pagesperso-orange.fr/gtello/downld_e.htm#prog

Then you just have to run DMASOUND.PRG and clic on the three TEST and
give me back the results (can you precise if you are running Aranym on a
Mac, a PC...) (you may hear some strange noises during the tests, it's
normal, the program uses the RAM as sound buffer and the RAM is not
always equal to zero!).

Thanks to all by advance...

Guillaume.

I own Calamus. which might have helped. But, if you find the Calamus web page, you will see a copy of NVDI 5, on CD, available for sale, for a reasonable price plus reasonable shipping. Try there first, and if that doesn't work, try here again.

Here's all the info:

Processor: Coldfire MCF5474, 266MHz, 400MIPS
RAM: DDR, 512MB Main- + 128MB Video- and special RAM on Board, Speed:
1GB/s
Flash: 8MB on Board for Operating Systems
Operating system: TOS3.06 for the beginning
Atari kompatible interface ports:
- TT/Falcon-IDE, ST/TT-Floppy
- TT-SCSI (but faster), ACSI
- ROM-Port: 2x2mm Connector
- Printer, ST/TT-seriel, Midi, ST-Sound over AC'97
- ST/TT/Falcon-Video
- Atari-Keyboard with Mouse

Other Ports:
- Ethernet 10/100, 1 Port
- USB 2.0 Host (ISP1563), 4 Ports
- Compact-Flash, 1 Port
- SD-Card, 1 Port
- AC'97 Stereo Codec with DMA-Sound Output and 48kHz Sampling Input
- Sound_Connectors: LineIn, LineOut, Mic (Mono); DVD/CD internal
- Coldari Video Modes about 2MegaPixel, true color
- PS2 Mouse/Keybord Port

Battery Powered (if desired)
PCI 33MHz direct Edge for passive backplane
Power controller with real time clock, PIC16F506
Extension socket: 60Pol (DSPI 8MHz, seriel sync or async about
33MBaud, 25Bit I/O about 133MHz, I2C-Bus)
Planed extensions in the future: Falcon DSP in the FPGA

Format: Card 90mm x 260mm x 20mm
Status: Wait of preorder (€200.-- advence payment), needing 25 for start project
Probability of realisation: 70%

Price for the Board: €599.-- excl. VAT and shipping; €357.-- left for preordered boards

# 4248. Wanted: Atari Mega ST4!

Newsgroup: comp.sys.atari.st
Date: 2009-03-27 09:57:05 UTC
From: Bravo Sierra Computers <atari@aracnet.com>
Message-ID: <alpine.DEB.2.00.0903270255300.20198@slate.spiritone.com>
Source record: 2265
Cross-posted to: comp.sys.atari.st,pdx.forsale

I'm Looking for an Atari Mega ST4. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. Preferably the 6 Chip TOS set as laid out on the MotherBoard. The important feature is this. The built-in floppy must be the Chinon. You can tell, the drive has an eject button centered under the floppy slot. The button is wide, short height & slanted on both the left & right side. This Chinon Drive is the Most Common ST Disk Drive! And the case needs to be unaltered, not cut up to replace a drive with an incompatible eject button. Please direct All replies via E-Mail to Atari@aracnet.com or call Ben anytime (503)256-9974. I need to keep this Within the U.S. as far as this Mega ST goes.

Why insist on a Mega ST4? Why not a Mega ST2 upgraded to 4 Megs?. Answer: I had a Mega 2 upgraded to 4 Megs. The upgrade failed & I don't want that again. I don't care if Jack Tramiel himself upgraded it and Guaranteed it. I want the Mega to come that way from the factory. I don't trust most other peoples tech work. I'd rather have the RAM put in at the Factory.

Atari 8 Bit and ST Games/Software, Hardware/Accessories and Books/References! FREE Catalogs @ http://BenSells.Atari.org or http://BensCatalogs.Atari.org or Catalogs Requested by E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST or Both! Or Call Ben anytime at (503)256-9974!

# 4253. M_Player 3.20

Newsgroup: comp.sys.atari.st
Date: 2009-03-31 17:11:44 UTC
From: Guillaume Tello <houten.van@orange.fr>
Message-ID: <49d24e4c$0$17758$ba4acef3@news.orange.fr>
Source record: 2271

Hello,

Finally, I managed to make M_Player run under Aranym. The "dirt"
programming is back!

I plan to improve two importants points:
- the disassembling of an animation (to TGA and sound)
- the creation of an animation (the BATCH file is a bit hard for most
users, I try to make a clearer interface)

- the direct conversion only works under TOS with a very ... personal
system (M_PLAYER calls a second M_PLAYER!)

Well, for those of you who made long time ago some sequences with
CyberPaint (*.SEQ, *.DLT) with Lexicor (*.FLM) or digitized videos with
Video Master (*.FLM) this is the chance to view them again if you don't
own your original Atari anymore.
And with the disassembling and creating functions, you should be able to
convert them to a more modern format such as AVI or MOV.

So, you can test M_Player under Aranym, just download it from this page:

http://pagesperso-orange.fr/gtello/mplayere.htm

Guillaume.

Try Best Electronics?

My first thought would be the power supply unit. I had one go out in my Falcon. If that's the problem, you could either buy a new one (very expensive - try Best Elec.) or if you're more mechanically inclined you could hack in a PC power supply (cheaper, but harder fix). Just be aware that the wire colors aren't exactly the same between the two. If I remember correctly (and I may not) the yellow and blue wires are the same voltage, but reverse polarity between the two. I didn't find this out until it was too late and had to replace a violently exploded transistor from my Falcon's sound system. Very exciting! Fortunately, that was the worst damage that was done.

Mike Freeman

I think the question was about the hardware.
For me the best solution is the one I can find. There are not too many
HD for the ST... So, when you find one, get it!
On my first STE I have a 160Mb SCSI Apple drive (taken from a MAC) with
an ACSI/SCSI interface (not Icd, not The link).
On the second one I have a Syquest 44Mb with the same kind of interface.

Those SCSI drives are faster than the original Megafile.

Guillaume.

I emailed Invers and got these 2 emails back

Robert:
I am sorry, but at the moment there are no NVDI 5 copies in stock
anymore. I will try and get new ones ...

the just got this one

Hi Robert.

I have reached the makers of NVDI and they informed me that the
relevant
Bitstream VectorScaler license has expired and cannot be renewed for
several reasons. Thus they cannot create new serial numbers for NVDI
for
legal reasons.

This said, I resume that NVDI is dead. Please try and get a legal
copy
from old Atari users who do no longer use it. Try and contact them in
several news groups.

Good luck.

Try a 40 ohm resistor between 12 volts and ground for a few seconds.
Sometimes revives a stalled power supply. discoect from Mega first, and
might work. These 20 year old switching power supplies sometimes get
flakey.

I emailed Invers and got these 2 emails back

Robert:
I am sorry, but at the moment there are no NVDI 5 copies in stock
anymore. I will try and get new ones ...

the just got this one

Hi Robert.

I have reached the makers of NVDI and they informed me that the
relevant
Bitstream VectorScaler license has expired and cannot be renewed for
several reasons. Thus they cannot create new serial numbers for NVDI
for
legal reasons.

This said, I resume that NVDI is dead. Please try and get a legal
copy
from old Atari users who do no longer use it. Try and contact them in
several news groups.

Good luck.

I dont know Dune that well! I prefer the 1st Movie over the Mini-Series on the Sci-Fi Channel! I prefer a Good Story over Good Visual! Please Reply! Please Answer! Please Reply Irregardless of your Answers! Thanx! =-=Ben=-=

# 4278. [UtD] ATARI Search Engine

Newsgroup: comp.sys.atari.st
Date: 2009-04-13 16:28:12 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <49e3681c$0$17090$ba4acef3@news.orange.fr>
Source record: 2296
Body handling: HTML body converted to readable text

The ATARI bookmarks page was
updated. The goal consists in valid links, even if it corresponds to
sometime dated information. Part of these bookmarks persist since the
creation of the WEB site, back to the year 1996.

The interest with those numerous bookmarks, there's more than 600, is to
constitute an ATARI uptodate and dedicated search engine of the online
scene. It is a service provided by Google Co-op. The base of this engine
is a collection composed from time to time. It's now quite consistent.

This is a WEB 2.0 experience, because even if I'm responsible for its
creation, the *ATARI Search Engine* can possibly be integrated by
webmasters adding the HTML code

Have a good ATARI WEB Surfing =)

# 4279. [UtD] ARAnyM miniPack

Newsgroup: comp.sys.atari.st
Date: 2009-04-13 21:45:56 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <49E3B294.7080709@atari.org>
Source record: 2297

Hi,

A new 0.9.7beta+CVS ARAnyM version <http://aranym.org/> is here
in the *miniPack* <http://eureka.atari.org/miniPack.zip> thanks
to Philipp Donzé's build. It supports

`MacAranym` allows launching on Macintosh with Mac OS X
`MacAranym JIT` allows launching on IntelMac with Mac OS X
`run_x86.sh` allows launching on PC with x86-Linux
`run_ppc.sh` allows launching on Mac _and_ PS3 with PPC-Linux

So Macintosh - PC - PlayStation 3 are all supported with both
Mac OS X and GNU / Linux.

This simple ARAnyM configuration is entirely based on Unices.
Here is a screenshot <http://eureka.atari.org/aranym.gif>

Enjoy =)

Source record: 2298

Hi,

M_Player can now deal with long file names and lower case names too.
So it is more compatible with newer systems (Ext2 partitions... etc)

That's version 3.21:

# 4284. TeraDesk 4.01 released

Newsgroup: comp.sys.atari.st
Date: 2009-04-20 18:37:00 UTC
From: vdjole@EUnet.rs
Message-ID: <gsifc9$703$1@news.eunet.yu>
Source record: 2152

Version 4.01 of TeraDesk open-source desktop for the 16-bit and 32-bit lines
of Atari computers is available at:

http://solair.eunet.rs/~vdjole/teradesk.htm

Please note the new location; domain name has been changed because of
recent political changes :(

The old URL should probably still be available for a while as:

http://solair.eunet.yu/~vdjole/teradesk.htm

This release fixes some problems that were detected when copying files
to network file systems ('access denied' error was encountered when
trying to set destination file attributes and user rights). This
seems to work correctly in most cases now except with some (not all)
nfs when user-id-mapping is set. See the history file for details.

Also, an improvement has been made in the shutdown procedure. Probably
because of ambiguous documentation, different AESes use different
parameters (wiscr vs. wisgr) in shel_write() to activate shutdown!
TeraDesk now tries better to account for these differences by setting
all of the alternative parameters. Btw. it seems that this issue is very
poorly documented and that none of the AESes implements the shutdown
procedure completely and as it probably was designed to be (e.g. what
about 'shutdown completed' message?)

Have fun.

Djordje

I see only 1 Atari ST (to be accurater) really active forum (on English lang. and don't think that there is some more activer on some other lang). Atariage, ST/TT section is not much active, and is on pretty poor level considering posts and moderating.
Unfortunately, http://atari-forum.com/ is controlled by crew Atarilegend. In practice it means that they can do whatever want, and some ordinary member who wants to point on some their mistakes will be declared as troll, upsetter and similar.
There are some really absurd things: unlisted moderators, moderators who visit forum once in 2 years. Moderators who can not write decent post, who insult people etc.
But what is my real problem there is lack of support for people doing something useful, constructive. Really poor communication level, in forum and in PMs. What I see there are irreal wishes, dreamings about some new games, HW, interfaces etc. But who will do it ? And most hard part: who will write drivers for those things ? People talking about USB on ST, but forgets about NET-UsBEE, made some 2 yers ago, still without any USB driver (mouse driver for is not USB, but PS2). Beside that writing drivers is not easy, and requires time, money (you need real HW to test them). But with current level of support and feedback, it is totally understable.

Someone asked how I think solving problems on my forum. Well - it is not so big deal, I think. Considering current group members and their supporters: they are welcome with every constructive and objective posting. Writing their own opinion. If someone will say something like: "program AB is bad, I read it at D-Bug.site..." it will be considered as spam, useless, will be noticed etc...
How to motivate people about giving better support for authors ? At moment I have this idea: just not hiding from problem by not talking about it (I even posted one topic about it on Atari-forum, but Techie Alison immediately asked to delete it, because it will 'make troubles'...). So, why not write that community is not in best shape, that we can do some things better. Pointing to people that getting goodies means some work, making effort. Effort from both side - users and authors. Nothing is free in real World. Every human action is result of some motivation. If it is not money, maybe some nice words, getting some feedback, or at least seeing that anyone tried, used it at all.

So, I want in first people doing some new stuff, improving existing ones to come on my forum. People who wants to contribute something, even if has no electronic, HW and SW knowledge. Everyone with some question about Atari HW, SW...
As I decided to abandon Atari-forum, everyone who want to ask me

something can get answers on new place.
And I doubt that there will be someone who can giving answers about some specific areas as IDE hard disks, drivers, TOS/DOS compatibility and other things. Many people with knowledge already left forum, scene.

Will new forum last or not - I'm aware that there will be not much people,. posting. But I care more for some quality, seeking truth and new, realistic solutions than mass of posts.

Petari

Source record: 2168

There is one french newsgroup fr.comp.sys.atari, but it looks like it
suffers from the same problems as the others:
- most posts are not directly linked to Atari
- a signifiant part of them are insulting, or realy bad jokes...
- when you try to talk about Atari... sometimes you dont't get any
answer, or something like that:
"why do you still use your STE? you should get a Falcon for your problem"
Or if you have a Falcon: "you can't use your machine for that, jump to
Aranym"
Or if you have Aranym "Your not a real Atarian, I use my TT!"
etc
etc

But still some posts are interesting, and a source of informations for
me. But, yes.. we're ot a community anymore, nor a family, nor working
together to share our passion.

We have a more general forum "ordinosaures" that could be translated as
"computosaurs" for retro computing. Talks about C64, Amstrad, Apple II
etc.. and Atari of course!

Guillaume.

# 4301. [UtD] ARAnyM miniPack

Newsgroup: comp.sys.atari.st
Date: 2009-04-28 09:40:06 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <49F6CEF6.9010607@atari.org>
Source record: 2169

Hi,

There's a 0.9.8beta release of ARAnyM <http://aranym.org/>,
so the *miniPack* <http://eureka.atari.org/miniPack.zip> was
updated. It supports

`MacAranym` allows launching on Macintosh with Mac OS X
`MacAranym JIT` allows launching on IntelMac with Mac OS X
`run_x86.sh` allows launching on PC with x86-Linux
`run_ppc.sh` allows launching on Mac _and_ PS3 with PPC-Linux

So Macintosh - PC - PlayStation 3 are all supported with
both Mac OS X and GNU / Linux.

This simple ARAnyM configuration is entirely based on Unices.
Here is a screenshot <http://eureka.atari.org/aranym.gif>

Enjoy, it's yours =)

Hi,

Interesting topic,

I for one, do not understand the need for a Web based Forem for Atari
Computers.
Not that I have anything against them.
What is the real problem for people using the Atari newsgroups for
communication?

Back years ago, we allowed about 4-5 lines for one's sig and off topic
remarks in here.
Back in the late 90s, this was the place were I found useful info and help
for software,
and hardware. Why has this changed?

The last thing that I want is to have to use a PC to find useful info, when
I can use a
STe or Falcon to grab postings off a newsgroup. But you can't do that if
there are none
to grab.

I go to the web based sites like AtariForum and AtariAge, simply because there are so many people there, and so much information posted. Both are great resources.

However, I agree with you Barry, because the newsgroups are accessible by just about any Atari user, even if they don't have Windows, Linux, a Mac or whatever. I'd like to see the Newsgroups be a priority for information *first*, then the other resources.

Just my 2 cents worth. (of course, this is coming from a guy who still thinks BBSs are a great way to communicate)... :D

In my opinion, alot of this has to do with "business".
Just about everyone is trying to make a buck off of everything now.
The want for Atari related products is still there, or Falcons would be
going
for $50.00 or less.
I can pick up just about any kind of PC or Mac for $200 or so.

If your business is Atari related, it doesn't help for someone to dump tons
of Atari Software on the Net for Free download.
This attitude has killed what was left of Atari Software developers.
Yep, I can do things on the PC/Mac that I can't on the Atari, unless I code
or
make it.
Same goes for the Atari, there are things that I cannot do on the PC/Mac
without
hiring a programmer and hardware developer.

It's sort of like Stamp Collecting, Everyone wants the really rare ones.
And some what to make a quick buck, by passing off forged copies.

You can emulate, but there's nothing like the real thing, and that applies
to just about anything.

If the Atari platform is so bad and worthless, then why do I see stuff
running on
PC's and Mac's that's been done years ago on Ataris.

Then there's the "Control" thing. Some think they must control ever thing
written or
done on the Atari platform. (Do it our way or well get ya). I've seen too
much of it.
It's smells of a old PC war of long ago.
It's a shame that some, really have gone to the dark side, and don't care
who gets
crushed in between.

BBSs are the way to go for some who do not wish to conform to the "New Way".

I'll continue doing my thing, because I enjoy it. Not cause someone wants me
to.

Yep, pictures/files are a big plus for sure. I agree they are certainly
much more active.

<snip>

> Ah the memories. Me personally, I can't see powering up the Hades, just to

If I can do it on my Atari,I'd rather do it there first. (not doing
usenet with one right now because my Mega ST is running the BBS, and
I'm still getting my EtherNat sorted out on my Falcon.) That's just me and
personal preference. I'm not slamming anyone who does it any other way,
its all about personal choice and I certainly respect that. I'm just happy
as a lark to see as many people still supporting/using Atari as we have! :)

> As for the new forum, its my understanding if I read between the line, he
> got banned, so presto a new forum emerges. You do the math. :-P

Ah, did not know that part of the story... Well, I hope we don't lose him
from the Atari community altogether - he writes some good software. His is
the only updated version of Ultima 3 that I actually got to work from a
hard drive on my STacy.

>

Well, you do not read it carefully. You show not good attitude :-)
Actually, I'm close to be banned, from reasons partially described.
I just want forum where I can write my own thoughts, experiences etc.
And this is what I can not on Atari forum. Because great Atarilegend
people gets 'upset' when i write some facts about their mistakes.
This is whole story about my 'banning'.
And banning means nothing - who insists my sign-in
with another username, mail address. Simple...

New forum will be much better connected with my site, SW and
HW projects. On big Atari forum my posts are just lost
in sea of other posts. On new forum they will be visible
very well, as there will be nothing other ! :-)))

About newgroup vs. forum : I think that modern forums are
much more advanced and faster way for communication
between people of same interest. Plus there is more freedom,
oprtunity to create rules, look etc.

Everyone can access forums somehow - if has no own computer
capable, or WEB connection always can visit some place where
it is present.

No, "he" is not banned. And you have very bad attitude :-)
"He" is maybe close to banning, because can not shut-up.
So, I just want forum where I can say my opinion, without
possible problems, 'football-hooligan' like jumps-in of primitive
people, where no group with privileges, and where people
understands what is constructive critic, and what is trolling.

I want forum where will be more attention on my posts.
On Atari forum my posts are just lost in sea of many postings.
On new forum all my posts will be very good noticeable - as
there will be nothing else :-)))

Cheers, Pera

Look buddy, I don't know you at all. But you are very easy on
accusing people.
I'm not at moment banned at Atari forum. It was for exactly one week -
just admin in that post was not sure then, or did not care. But that
ban was total nonsense, as I did not break any rules. I just pissed of
some smartheads. And it was not surprising, and for some time I just
don't care about all it...
That about multiple accounts is bullshit, placed by D-Bug who always
when someone complains about them, their patches coming out with story
that it is me with some new account.
Little sense for humor maybe ?
To repeat: Atari scene is spoiled by crews, groups which behave as
they do, know things best. They do not listen to constructive critic.
Some of them place lies around. Only blind people sees not how
nonsense is this: " ... as it is known to wipe out whole Windows
partitions without any sort of recovery!!!" Self referencing - it is
'known' only among D.Bug. Wiping whole partitions is something what
takes time, Windows is protected against... etc.... Their comments
are 'really useful' ....
I just walk my way.

You buffoon! You've been caught red handed multiple times trying to
post on the d-bug forum AND atari age! I even swapped IPs with AA and
we got a perfect match that it IS you!

So please, either shut up, or dare me to prove my point. I dare you
publically.

> To repeat: Atari scene is spoiled by crews, groups which behave as

> are 'really useful' ....

Yeah, especially since they happen. I used your program. I used it
with some success. Then at one point, I tried to access one disk. Then
everything locked up. Then I rebooted. Then no system was to be found.
Way to go!

Also, a friend's zip disk was totally wiped by running one of your
"adaptations". We pointed that out several times, but you turned a
deaf ear at that.

> I just walk my way.

Yeah, and I hope you like walking alone...

all the proof is available!

# 4317. New Video Adapter for S-Video On Atari ST Systems

Newsgroup: comp.sys.atari.st
Date: 2009-05-01 18:07:57 UTC
From: kjmann12@yahoo.com
Message-ID: <2b865b70-0610-4f21-a89c-46694876609b@a5g2000pre.googlegroups.com>
Source record: 2185

After some careful thought and some trial and error, I have come up with a design for a Video Adapter for the Atari ST/TT systems that will provide S-Video and Composite Video for all Atari ST/TT systems that use the DIN 13 pin Video Port.

This Unit Will Work Even if your ST/TT Does not Have an RF Modulator Built in.

This Adapter not only provides a Beautiful S-video Signal and a Decent Composite Signal, but will only cost about $60 USD as a complete unit. (not just a board with components)

It also fixes the problem with over Drivin signals coming from the RGB lines. So the Picture you get will be Bright and Crisp with no blurred Colors or that Grainy look.

As an Atari ST User Of many years I have always taken note of the fact that not only is it expensive to buy a refurbished monitor (shipping etc.) but It is also very inconvenient to have an extra monitor set up in the house. This unit works in NTSC only (I'm Still working on a PAL version). The S-Video is so Good on this that I can't hardly tell the difference between the adapter and an Original SC1224 RGB monitor.

I don't know how soon that I will have them available but I hoping to have them ready to ship to Video61 no later than Mid May.

there's a mock up of what the Unit will look like completed on atari Age in the ST/TT discussion area

# 4318. Smurf 1.06

Source record: 2186

Anyone know how to get in touch with any of the Smurf authors
since it went GPL?

I am currently translating the remaining German in the PRG, HLP
and module files etc. of V1.06, and want to send it to them for
distribution - or if not them, where?

I want to find out where the PATHS.STR file belongs, since I can't
get Smurf to recognize it!

I also purchased the previous 1.05 version, which has an
ILIST.DAT file in it. What does this do, and where does it belong?

Any help welcome!

Regards, /Peter/

Source record: 2196

Has anyone gave any thought to how we can protect our,
intellectual property when we post to this group or other
forems?

Most of us have came up with new ideas, projects and new
ways to do things, and posted them here in the past for others
to use. Most of us have creativity and want to share it with others
who use a Atari Computer or emulator.

But I don't want some company making a fortune off my ideas, unless
I get my part of the fortune. Working to make someone else rich
while getting nothing in return is not the correct way to do things.

You might want to check out the following before posting that next
idea, invention or etc.

http://bits.blogs.nytimes.com/2009/03/30/trolling-for-patents-to-fight-patent-trolls/

I've just recently started looking at how big this problem can be.
I'd like to here from anyone who has more knowledge on this and
how we can best protect what we post.

# 4329. Re: New Atari forum

Source record: 2197

As I could expect, nothing new to read here. Just same, old
bullshit. So, I will say last time: I don't have IP. It is changeable.
Plus, I came on D-Bug forum somewhere around New Year to calm things
down and try some normal relationship. At very start CJ acted
antagonistic. After about 1 week, some locked threads, they banned me
without any explanation and ground. Except if we not count that I
fixed bad 'release' of Helter Skelter, hard disk 'adapted' by ggn, who
obviously had better things to do instead testing it for 10 minutes...
And that I asked explanation about his brutal posting, considering my
post about that gamefix (titled 'trolling'). Ahh.... all it is
actually totally ridiculous.

Just to reply on one concrete thing: "Also, a friend's zip disk was
totally wiped by running one of your
"adaptations". We pointed that out several times, but you turned a
deaf ear at that. " .

This is another example of seeking something bad from me, at all
costs. That Zip data loose (not 'total wiping' - again same
overstate) was solved.
Problem was likely intro what I did not remove from game Bomb Jack.
Because crack was protected, maybe better than original game. At
least after removing it 'wiping' not happened again. Of course, all it
could be because from something totally different . But best solution
is to blame me....
Lies, lies, as always - you never pointed anything concrete, I was
informed about problem by owner of that zip, and solved things after
couple PMs. And he said me in beginning that I'm 'known' as someone
who ignores users complains, observations. Of course, we can guess
about who placed that.... Stalin, McCarthy would be proud on you, ggn.
Of course that I'm now 'deaf' - most what ggn says about me is total
crap.

Soon I will publish new game storing/restoring system. And certainly
some people will find that it is something bad, stupid, stolen or
similar. Please, don't surprise me :-)

Of course, this post will change nothing in mind of people. Most of
people just don't care for facts, thruth, some better communication.
They just follow some "respected" ones, use 'best' SW, etc. We are on
level of football fans, nothing better. Feeling better, smarter when
in some group against solo person. I call it just cowardness. Lack of
own opinions, views.
I'm not Atari-lover. It is just another firm for me, with good and bad
sides. It just happened that I bought Atari ST in 1987, because it

fitted best my needs. Likely, half year later I would buy Amiga 500, but at that moment it was poor with SW.
Some 4 years later situation with SW was much better for Amiga, just to remind.
So, I do what always did with computers: doing some new SW, HW add-ons, what I see that can be done relatively simple, cheap, and exists not.
So was with IDE hard disk IF in 1992. So was with Floppy Imager for Windows XP. I made it because it was need for.
So I do now some new stuff. But some people must be asshole and writing complete nonsenses, lies about. Nobody forces you to use anything of my stuff. If you have some normal observation, comment, bug-report, then please write me.

Forums, E-mails are for such things. Instead those, normal ways some smartheads do spitting on their sites, forums reserved only for likers and lickers ( :-) ) and then find to say that I do not react well on their pointings. I reacted total normally - I said that it is bullshit. D-bug just pointed nothing useful, true. Most of theit 'pontings' contains nonsenses, lies, what is actually easy to check. But who cares for facts. It's always easier to have someone for 'usual suspect'.

Y'know, there was a time when I was as Atari-geek as the best. I really
find it hard to believe that anyone is going to miss out on a fortune by
having Atari ideas stolen in todays world, though.

its obvious that a person should be rewarded for there good ideal,
whats difficult is the fact which faces us that if something is good
then everybody likes then wants it,,,but has to be proven before the
wheels go in motion,, where as opposite bad i deals get frowned upon
and disregarded....

my only input might be , have your ideal done or at least done in
rough , and only expose the thought of the ideal , not the real full
program ,,,,

especially if on your atari , i can't see it being that
revolutionary , but who knows... you know ,

why build a trampoline for people with no legs!

so don't be worried
cause your not the one going to do all the hard work ,its just your
ideal
until you commisin on a team to debug,write,develop and launch
this ideal.. its only hypothetical "dust in the wind" as said

i have ideals too but its child like to just sit here and believe with
the five years programming experience i have that my program is going
to make me wealthy

it just is a positive step towards the contribution to the atari
computer wrealm

exposure another good point , i 'll stop now.. blab blab blah...

Well, currently I'm tied to my room because of injury.

As I said, nothing will change in people's mind. Believe what you want. Hate me if you like to hate.

To GFA-Basicer: Independent 3rd parties, admins: as CJ... . Or some Sauron on Atariage who recieved tons of PMs from ggn, CJ with complains against me. I asked him to remove me from Atariage, and I'm over with their 'independent moderating'... Or Atarilegend people at Atari-forum...
You really know the things.... blah :-) Actually you proving my reasons. Locked down threads are reason for starting own forum, where people can say what want without that some stupid prejudiced '3rd parti' deletes it because is afraid from some hated discussion (discussion, not football-hooligan like posts). Or because someone dares to say that some moderator, crew member is ignorant.

Source record: 2203

Hello,

just a short reminder: in case you are still interested (we all know how frustrating was that Paypal story), you should start thinking about sending the money -- the deadline is end of this month (May the 31st).

All payment options and information is available at http://ultrasatan.atari.org (either on main page or after you log in and select appropriate number of devices plus your country).

If you know anybody in your neighborhood who could be possibly interested in this device, please point him to mentioned website. Even now I'm receiving mails about how people got the knowledge about it just a few days ago (no kidding!)

P.S. Many people have sent their money via Money Bookers / Western Union / bank transfer / cash in letter and I've got *every* payment so there's nothing to worry about (except some lack of comfort). If you have any questions, feel free to contact me.

# 4336. GAMEX announce

Newsgroup: comp.sys.atari.st
Date: 2009-05-06 13:08:21 UTC
From: pp <ppera@ppest.org>
Message-ID: <5625b722-5d4e-4e59-8829-57dab4aa44c6@n8g2000vbb.googlegroups.com>
Source record: 2204

I present system, what I named GAMEX (gaming extra, games exitable)
for Atari ST and compatibles, which allows some partially seen, some
new things: recording gamestates (snapshots) on disks and playing
later them. New is option to play state stored in RAM and launching
gamestate files with common utility (no need for specific game
starter). So, user can after couple mouse clicks find himself at
certain position in game. In case of games not using TOS calls it will
work even with different TOS version than used by state saving.

This will work with min 1MB RAM for most of games - those which
normally run on 512KB machines. So far, I adapted 3 games: Sideways,
Flight Simulator II and Virus. Will do some nice games, where
gamestate save has sense or works not with hard disks in near future.
And as it goes in this waters, already some idiotic comments appeared,
but honestly, I would be surprised if it did not happen.
More explanations, DL, videos here: http://ppera.07x.net/atari/fromhd.php?s=d

# 4340. Oh no, not again !

Newsgroup: comp.sys.atari.st
Date: 2009-05-07 13:22:23 UTC
From: pp <ppera@ppest.org>
Message-ID: <26306bd6-598a-4b69-84ee-6b04e135f7f0@e24g2000vbe.googlegroups.com>
Source record: 2208

I know, I know, it's boring, annoying, useless etc...

However, according to law, every person has right to public reply on writings against him, and expose his arguments. (spare me with 'ignore' advices - not my case.)
As other side do not allow me to reply there, I must post here.

"Rest assured I'm not going to let one narrow-minded, hypocritical, bickering, Hungarian Troll remove me from the Atari world no matter how many of my ideas or lines of my code he tries to take credit for. The folks in Atari-land who have been here long enough to matter know the truth, the misguided newcomers can enjoy having their partitions wiped clean."

Well, this is pretty schowinistic pointing on someones nation, what is btw. even not correct. My fater was not Hungarian, and it counts. So, dear CJ, nobody wants to remove you from Atari World. Everyone should have chance to do what likes here. Some competition is even good, as is known. You exagger everything. I did not say that ULS is bad. It is just not good for everything. Forcing ULS at all cost as in case of Sideways is by me pretty bad solution.

Then, you need to write some good arguments about that stealing ideas and code. What posted there (code snippet) just proved your shallowness and lazyness to even check simple things before write. (Please visit their forum, read Entering Hiatus thead and will see what I talk).. So, you actually made full from yourself, and stopped with talk about Gamex, but started old 'good' tactic - counterattack. With usual bullshits, lies, absurd nonsenses.

It is sad to see how many people (10 is many for me in this case) believes all that crap inspired only by your sick mind and inability to admit that someone other can know something.
And even lazy to get with something new, so pulled out old 'wiped' blah-blah.

Stealing ideas ? About making snapshots ? Known for decades. Storing/restoring MFP ? How to hell preserve machine state without that ?
Next what I will read is that I use same user interface as in CJ's creations - keyboard, so I took his 'idea' .

Please, go and heal yourself. You are welcome to come back with changed mind.
Maybe we will even talk like humans.

Get off the internet already you damn drama queen. First you've been banned on the d-bug forum, then atari age, then atari forum. And it's all because of you.

You don't like D-Bug views, you don't read them. Instead you go whine on every source available.

The good people of usenet don't ban people. Instead, they killfile people. So in essence pretty soon you'll be talking to yourself here.

Try not to get banned from your own forum too....

Hahahha.... Thank you, I'll do my best, I promise !

Now, the less funny part: I was not banned from any normal forum (D-
Bug is certainly not such).
Moron Mug UK just did useful thing (as always) : banned member who
left the forum (in same thread with goodbye) :-)

It is not about do I like D-Bug or not. It is about human behaviour.
About placing lies. About poisoning this area.
You jast behave like you have all right to do some things. When
someone does something better in same area, you start with brutal
attacks - as happened in Helter Skelter case (saying that I stealed
your 10 byte long PSG patch).
Now, only few hours after putting post about new Gamex you had fun
with writing complete bullshits without any checkings, and made fulls
from ourselves. And finally, CJ comes with moaning about that I want
to push him out, that I steal his code and similar. This are serious
charges, even from someone who says that likes to talk shits.
So, to repeat, all what I want is that you start to act as civilised
humans. Stop writing bullshits and lies. Allow people to do what they
like to do. Point is not in beeing the best, but doing best what we
can.
You know well that snapshotting is known for decades. How saving
machinestate goes. You discovered nothing new, and even if would, it
is not something what anyone would patent. In fact, all it is just
quick idea, what may be developed with less-more effort in working
form.
I just had such quick idea one morning, after couple days of
experimenting with fast RAM paging. Then I realised that I can do
something more useful than swapping 2 TOS versions. Other
predisposition for this project was solving of permanent high RAM
allocation (disabling from TOS even after PRG exit), what I finally

did about 1 month ago.
Now I add some new ideas as option for note, HW, TOS version of machine where it is done storing in snapshots. All for user's benefit.

## 4349. Cleaning out garage

Newsgroup: comp.sys.atari.st
Date: 2009-05-08 15:59:37 UTC
From: ronald wicker <rwicker1@verizon.net>
Message-ID: <JFYMI.25$wR5.21@nwrddc02.gnilink.net>
Source record: 2217

I am in the process of cleaning out the garage and ran accross some old Atari Equipment. The list is as follows:

Games(modules)

Space Invaders
Star Raiders
Mega Mania
Ms Pac Man
Breakout
Berzerk
Missile Command
Sword Quest(Early World)
Adventure
Pac-Man
Asteroids
Combat
Defender

1ea Atari 850
3- Power Supplies
4-Joy Sticks
5 1\4 diskdrive
cables and accessories

I don't know what these are worth but will accept highest offer plus postage from 77565.

Ben,

Someone correct me if I'm wrong (it's been a long time). Apex (Media?) is an art/animation package that is capable of full "TrueColor" (16-bit) color, and can make use of Nemesis to reach a 640x480 on-screen TrueColor mode. It was pretty nice. I only used it once or twice, though.

Also, and this is a totally picky thing (I'm a writer), so don't take offense at this: it's regardless, not irregardless. Sorry, but that's one of my pet peeves. I'm just picky that way.

Hope that (at least one of these, anyway) helps!

Ideas are a dime a dozen. Everyone has them, but the successful people put in the hard work to execute them.

My million dollar idea would be a handheld ST or Atari 8-bit in the size of a Game Boy but with a keyboard like a blackberry. Add wireless and sell it for $100. There's an idea for someone to make a lot of money with. :-)

GP32, Chatboard and CaSTaway would come close to this, although the
chatboard isn't the most wieldy of accessories. I believe there's
some USB wireless type project with the GP32 as well, totally not
up to speed on it all though, and I doubt CaSTaway will understand it.
What would you expect to use the wireless for?

Wireless for email and some Internet. Run a stripped down browser like
Opera Mini, where the heavy lifting is done server side. SSH would be
nice but I think would require too much CPU.

I started recently project which will likely take some time...
Disassembling TOS 1.04 and then doing some combinations and
modifications.

Disasm. of GEMDOS part is done. And I have already something useful:
'TOS 1.08', what is hybrid of TOS 1.04 and 2.06. It offers some
benefits ....

More here with DL :

IMHO you should not call it TOS - it is not TOS and such a name will
confuse things soon.

Not TOS ? OK - maybe to call it Windows 92 ? ... but Bill Gates
will not like it. They forced Windows Commander to be renamed to
TOStal Commander ;-)

ATARI produced TOS. Patches to TOS were called e.g. KAOS. You're
inserting version names of TOS and breaking up the order:
- TOS 1.04 by Atari
- TOS 1.06 by Atari
- TOS 1.08 by you, but based on 1.04

That's confusing. Really.

I think he meant not "TOS x.yy", which are the way the official
(historical) TOS are named.
PPTOS, NewTOS, WonderfulTOS or whatever would avoid confusion.

The name "TOS" isn't yours to begin with. Call it ppTOS or whatever to
avoid confusion.

Too bad that everyone talks about the name and not about the quality of
his work.

Sure that a TOS without bugs and with some improvements would be cool
for our machines.
He can call it VISTA if he wants as long as his work is useful!

BTW, do you know my "little" work "COLORSTE" that brings color icons and
color widows elements in ST Low?

This could be added...

Guillaume.

I think that you guys take all this too seriously. It is little too late for that. Only few people will use this 'creation'.

I did not change a single byte in TOS 1.04's GEMDOS part, and did not change anything in GEM (AES, Desktop) part of TOS 2.06. I just combined them. In theory it could be done in half hours, but because of address conflicts I needed first to disassemble GEMDOS part of 1.04 together with keyboard tables and system fonts (located after AES).
So, it is TOS. 100% TOS. It is just not official TOS. That's missing from your comments Götz.
Nothing is patched (yet).

For me it would be easy to call it PP, Putnik or whatever, for Atari hacked OS.
But I have in mind SW for detecting TOS version. I could leave there 1.04 . But when someone will see desktop of 2.06 will be really confused. So, I decided to put there something not present, something between 2 numbers.
TOS version numbering should be for both GEMDOS and GEM, as I know. There are separated version numbers for AES and GEMDOS.
This is why I bracketed it here, why I put smiley in thread in forum. Just a compromiswise solution.
If someone has idea how to achieve that SYSINFO will outprint my name (instead 'TOS' ) when detects running OS, let me know :-)

Yes. And you just confirm with second paragraph what wrote in
first :-)
Such thing actually exists. Maybe price is higher, I don't know what
exactly we have on market currently.

Surely nobody will produce machine with some 68000, 8 MHz CPU and
few MBs of RAM this days.
But we have some handhelds capable to emulate ST (and many more).
And now we are back again by SW problem:
I have what you described for couple years: PDA. With bluetooth.
Only without keyboard, but such things exist for PDAs. We have CaST
CE emulator running on Windows CE. And this is weakest part of whole
combination. It is slow (on 400MHz ARM), it crashes, freezes often. UI
is not solved well, etc.

So, please do SW. Ideas we have enough :-)

Hello Pera,

I think this debate is kind of storm in a tea-cup... :-(
You could name it whatever you want, letting it be detected as
actual TOS.
You didn't patch anything so far, but had to do some work in order
to mix the 2 versions.
So, yes, it's still detected as TOS by other apps, but no, it can
be considered as non official TOS.
Name it whatever-you-want-TOS and go on with this great piece of
work, so everyone is happy. :-)

J.-Luc

Hi Gui :-)

I think that I saw it earlier. But now can not find it with Google.
Although I did not plan to bother with GUI (Desktop) part of TOS, it
may be good addition.So, please some link where can obtain it...

Hello,

You can find it on my download page, look for COLORSTE:

http://pagesperso-orange.fr/gtello/downld_e.htm

Program and sources.

Guillaume.

Thanx. I looked little in AES, Desktop structures. There is no
support for multicolor icons in TOS 2.06 (AES 3.20) and earlier. So,
to adding your solution we would need to disasm AES, dig in it, etc...
pretty hard task. I think that best if COLORSTE will stay as
installable APP. Maybe to do support for some other TOS versions.
I did some simple changes in Desktop.rsc of TOS 2.06 .
Here about, with screenshot: http://ppera.07x.net/forum/viewtopic.php?f=4&t=23

I missed the thing that you had a 2.06 for the AES.
So COLORSTE is not the good one...

I wrote COLOR _MSTE, it brings color icons and, if you have a graphic
card, 3D effects on the windows elements.

But again, I think you're right to let it as a external patch.

Guillaume.

It just confuses those, who doesn't know that there were no official
TOS 1.08.
Btw. I've just checked the so-called KaosTOS. In the about window it
says: "TOS30". The patched TOS 2.06 (SuperTOS) reports itself
completely the same as if it were Tos2.06. So I don't think there is a
standard here. And the way you name the image file of the TOS or the
link in the browser (Supertos fe. refers to" TOS2.06x.img"), is
completely marginal question.

I have lots of Joysticks for sale! Atari. Epyx 500XJ. Wico 500XJ. GemStik. Kraft. Mindscapes PowerPlayer. Pointmaster. Prostick II. SpectraVideo. Lots of Suncom. A whole lot of Wico! And a Questar Adjustable Speed Blaster to speed up and Auto-Fire any Atari compatable Joysticks.

To expedite your order, Download Catalogs, Delete what you dont want, E-Mail me the rest! To expedite your order, please E-Mail me your Mailing Address so I can figure Postage & Handling and I can expedite your Order!

My Atari SoftWare and Book Catalogs are sorted alphabetically by Title so you can find the Titles you want! When ordering, please keep Titles Alphabetical!

Atari and compatible JoySticks are 20% off! Joysticks work with Atari 2600/7800/8-Bit/ST/Commodore/Amiga/ColecoVision and FlashBack 2 made by Atari!

http://BensCatalogs.Atari.org WEBSITE & FREE ATARI CATALOGS!
http://www.aracnet.com/~atari/ftp DOWNLOAD ATARI LISTS CATALOGS!
http://www.aracnet.com/~atari/specials.htm DETAILS ON SALES!
http://www.aracnet.com/~atari/8bt_hard.htm 20% OFF ATARI 8 BIT JOYSTICKS!
http://www.aracnet.com/~atari/st_hard.htm 20% OFF ATARI ST JOYSTICKS!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari 8 Bit and ST Games/Software, Hardware/Accessories and Books/References!
FREE Catalogs @ http://BenSells.Atari.org or http://BensCatalogs.Atari.org or
Catalogs Requested by E-Mail at Atari@aracnet.com or BenSells@Atari.org and
Please Specify Atari 8 Bit, ST or Both! Or Call Ben anytime at (503)256-9974!

# 4387. Re: Hybrid TOS

> You're inserting version names of TOS and breaking up the order

That's true.

> That's confusing. Really.

A littel bit. But there also a TOS 2.95 and 7.0x which are not form Atari.

Gerhard

# 4388. Re: Hybrid TOS

> So, I decided to put there something not present, something between 2
> numbers.

Maybe the wrong the number? 1.06 ist for the STE and also the 1.62. For what machine is for what is the 1.08.

> TOS version numbering should be for both GEMDOS and GEM, as I know.
> There are separated version numbers for AES and GEMDOS.

A short part form the tos.hyp.

```
version date name GEMDOS AES
1.04 06.04.1989 Rainbow 0.15 1.4
1.04 06.04.1989 KAOS 1.4.2 0.16 1.41
1.04 06.04.1989 KAOS 1.4.3 (08.06.1994) 0.16 1.41
1.06 19.06.1989 STE 0.15 1.4
1.62 11.01.1990 STE 0.17 1.4
2.01 0.19
2.05 05.12.1990 0.19 3.10
2.06 14.11.1991 0.20
2.06 10.03.1992 STBook
2.95 26.04.1996 0.20 3.20 Tos2Win
```

Can someone tell me the GEMDOS and AES version form a STBook TOS?

> If someone has idea how to achieve that SYSINFO will outprint my
> name (instead 'TOS' ) when detects running OS, let me know :-)

If you have the sourcecode... ;-)

You can do something like EmuTOS, this add a four byte name to the end of OSHEADER.

I currently do some enhancing, patching of GEMDOS 1.5 part of
Hybrid. So, there is now DMA sound detection/init and mixer init, IDE
boot, cookies - with showing if machine is STE, and if has IDE IF.
Changed floppy bootsector layout, so it will have 3 sectors long FAT
instead dumb 5. Need yet to patch date XBIOS functions to Y2K
compliance. Then I will test it on STE and submit with source code,
where are some comments, explanations added.
Did couple color changes in Desktop (v 3.10), so it will be visible
'from plane' what is in question...

So, this is for ST (only capable to access area at $E00000) and STE
machines. Maybe will work on Mega STE too. But it is not so important,
I think. MSTE has different serial port, and I will not bother with
patching it.
There is now 8KB free space before AES part in ROM, and more at the
end. Almost 2 KB free in RAM, so may add many things yet...

It's not bad idea to add some name/signature in last 4 unused bytes of
OS header. Maybe PPTM (PP TOS monkeying ;-) ).

That's too much then. No confusing facts would be better and it is so
_easy_ to choose a name that is unique. And can be easily found with
search engines.

'Official' name from now is ppht (sorry, no capitals !) or longer
variant: pp hybrid tOS :-) Even longer variant I will not write here
considering Worldwide economic crysis :-)
But Sysinfo will still show it as TOS 1.08. Even if I make some new
sysinfo, most of people will still use old one.
I think that we talked too much about less relevant things. Really
interesting things will just came later...
Think how to call low RAM use-less (not useles ! ) GEMDOS variant.
How to call DOS compatible FAT16 handling in GEMDOS ?

Just one thing: If you choose 1.04 for compatibility reasons, why
change the version number? Won't this confuse some of the games/demos
you attempt to stay compatible with?

I saw only couple games which check TOS version. And I did not change relevant thing: GEMDOS version # . There is Trap #1 call for get it, and PRG will get version of GEMDOS used in TOS 1.04 (0.15). GEM version may be relevant for few games using AES (Deja Vu, Sim City, Psion Chess... and I can't recall more), but I don't think that they will check TOS #, but rather AES version with proper AES call.

Compatibility with majority of games means not following the rules set by Atari (not always consistently). Problem is usually exactly that programmers did not follow rules. Of course, reason is in most of cases intention to use as much RAM as possible in limited 512KB machines. Other reason is speed. Then we have Timer C problem with TOS 2.06. I know about 6 games which work not in TOS 2.06 (and Falcon) because of that, but there is for sure much more. It looks that in this case Atari is culprit. At least I did not see any mention about that stopping Timer C is not allowed when using system calls.
Actually, compatibility raises as we go to lower TOS versions, mostly because of RAM usage. But TOS 1.02 and especially TOS 1.00 are not for hard disk usage really. So, as best choice we have 1.04.
In other words: most of games checks nothing. They place code or data in low RAM because it was OK with TOS version what existed in that time, and with running from floppy. By higher TOS versions we have more low RAM allocated for system, + hard disk drivers allocate low RAM too, so conflict is inevitable.

This 'hybrid' TOS actually not solves low RAM problem, because low RAM usage is practically same as by TOS 2.06.
But it is just first step, result of disassembling. Next thing (on what I work currently) will let whole low RAM free for games - but will not work on 512KB machines, as we have to place GEMDOS's RAM workspace ( 25KB + drivers, usually 40-50KB), somewhere...

# 4397. Re: GAMEX announce

Newsgroup: comp.sys.atari.st
Date: 2009-05-25 12:36:01 UTC
From: pp <ppera@ppest.org>
Message-ID: <3cd48ddb-1174-4ce5-af1d-70c4af2f412c@l12g2000yqo.googlegroups.com>
Source record: 2065

Some new possibilities, considering compatibility and easy to use:
thanks to disasm. and analysing of GEMDOS now I work on : launching
games which working well only from AUTO folder (so need booting) -
from Desktop. This is possible by quick set-up of little stripped
GEMDOS 0.15 (from TOS 1.04) . And it offers much better compatibility
than TOS 2.06. It can work under any TOS. Quick is because some
unnecessary things are out - as floppy test, boot . So far I did
Starglider 1 - it runs flawless under TOS 2.06, and starts very fast.
And good thing is that it can be combined with GAMEX - there is enough
free place in 512KB to place GEMDOS 0.15 with hard disk driver,
buffers, + copy of working Desktop, TOS from which we launch.
So, we will have easy launch, high compatibility and possibility for
statesaves. Only condition is 1MB RAM for most of games (which work
with 512K normally), and of course some work in adapting games...

# 4398. Doom, Heretic and Hexen v 0.56

Newsgroup: comp.sys.atari.st
Date: 2009-05-26 20:02:53 UTC
From: Patrice Mandin <patmandin@gmail.com>
Message-ID: <4a1c4aed$0$17785$ba4acef3@news.orange.fr>
Source record: 2066

```
All games:
- README list supported game data files.
- Added -iwad /pat/to/gamefile.wad command line parameter.

Doom:
- Fixed bug when saving game, was corrupting memory
(Thanks to Sascha Uhlig for report and testing).

The ports are built with SDL 1.2 (svn 20090526) which have the following
things changed, compared to SDL 1.2.13:

- Xbios video driver disabled when FVDI present.
- Teamtap autodetection on joypad ports
(Thanks to Fredifredo for teamtap and joypads).
- Xbios audio driver enabled for Magic
(Thanks to Sascha Uhlig for testing).

Ports are available on my website.

It was a terminal emulation program by John Palevich (sp?) originally distributed through Atari's APX program.

I used Chameleon (tape version) many times to submit programming assignments to school (way back when). Using tape and the slow transfer rate (300 baud) was incredibly cumbersome but it beat driving to school at 2:00 AM (the only time the campus terminals seemed to be available).

There was also a loadable desk accessory called Chameleon. It allowed
you to load and unload ACC's at will.

I was in the same boat, used it most of my freshman year with my little
xm301 modem and 800xl. I at least had a disk drive though. :-)

There is nothing on the market with wifi and blackberry form factor
for $100. The closest could be the old Palm Tungsten C, but that was
$300 when it was available. Something with an older chipset, wifi, and a
320x240 screen should be available for $100. Look at the Nintendo DS.
It's $130, and it has everything except a keyboard.

Yes - I found it seful before I got MagiC. But you couldn't unload
the multi-accessory Harlekin with it! :-(

# 4420. For Sale: Atari Falcon 030

Newsgroup: comp.sys.atari.st
Date: 2009-06-07 03:41:53 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <QCGWI.51664$b9.22056@bignews6.bellsouth.net>
Source record: 2088

I've a Atari Falcon 030 for sale.

In really nice clean condition, comes with the following...

Stock Falcon with Tos 4.04, upgraded to 14megs with a Ram Gizzmo board.
Factory case, keyboard, mouse, manuals and disk software.
Has a working internal Seagate IDE hard drive, (60-80meg drive).
Motherboard has not had any major hardware upgrades.
Also comes with RGB and VGA monitor adapters and PS cable.
Ready to run and comes in a original Falcon Box.
Also included, Like new Printer and SCSI cables.
No dust or dirt on motherboard.
Needs to go to a good home, out of room here.
If you've been looking for a good one, this is it.
First $850.00 takes it, shipping and insurance included if in US/Canada.

Serious inquires only please!
E-mail if really interested, will give phone number if you need a verbal
conversation to
complete the sale/purchase.

Other Falcon related Items...
---
4-meg Factory memory board-$45.00 shipping and insurance included.
Factory Falcon Power Supply like new-$60.00/used-$35.00. shipping and
insurance included.

ST/e Items
---
Vidi ST cartridge like new in box with original disk software
and manuals.-$40.00 shipping and insurance included.

E-mail me at phantomm@bellsouth.net
.

## 4425. Stacy power supply

Newsgroup: comp.sys.atari.st
Date: 2009-06-07 10:32:05 UTC
From: Guillaume Tello <houten.van@orange.fr>
Message-ID: <4a2b965c$0$17104$ba4acef3@news.orange.fr>
Source record: 2093

Hello,

I have a Stacy without its power unit. But I have an IBM one with those characteristics:

OUTPUT 20 - 10 V =
2.00 - 3.37 A

Can it be used as a replacement?

Another question... This IBM AC adapter has 4 pins:
1) Ground
2) +
3) -
4) Input signal

What is the 4th for??

Guillaume.

Source record: 2096

Hey all,

I troll my local Craigslist twice daily for Atari stuff and wouldn't you know it an Atari 520ST with 1MB, 2 SF314's, 1 SC1224, and 1 set of VERY archaic (full height) scsi drives with what looks to be an adscsi was sold to me for $30. He said he had all kinds of responses but I was the first to actually show up or even make an appointment. It's really nice to get ahold of what is an exact copy of my first computer ever and at such an ebay (shipping, bleh) beating deal. This time I won't let go of it so easily ;) I've been doing this for a year and a half! It takes dedication.

I traded my TT for a Falcon last year, but this was a TT with an aixTT
fastram-card and a Crazy Dots graphics card. Traded it for a slightly
dodgy Falcon with a partially working BlowUp FX speeder.

I never used my TT anyway, so I don't regret trading it. The TT (with
graphics card!) was superior in most aspects, but I like the Falcon
better.

I seriously doubt that it is real USB mouse driver, but PS2 driver.
USB and PS2 are practically HW compatible, considering used lines.
Maybe that Jan Thomas explain it, and perhaps publish source ?

Just keep dreaming further about that someone will make serious USB
drivers for Atari ST. With current support and feedback hardly will
someone start such big project.
Other thing is possible speed with current USB interfaces. USB is
pretty demanding, so to have some good speed on slow Ataris USB IF
should do most of job, and poor old Atari should handle only decoded
raw data.

Hello!

Here are the latest BITS productions:

BITS#42 entry to Outline 2009:
http://thebitsclub.tripod.com/BITS42-ST-OUTLINE-20090520.ZIP

BITS#43 little 512 Bytes bootsector intro:
http://thebitsclub.tripod.com/BITS43-ST-20090523.ZIP

BITS#44 Atari ST character set utility:
http://thebitsclub.tripod.com/util/BITS44-ST-20090524.ZIP

Greetings,
SoLo of BITS (bits.atari.org)

# 4441. ST-Falcon PC hardware emulators

Newsgroup: comp.sys.atari.st
Date: 2009-06-09 00:40:49 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <A0iXl.8158$Xw4.5050@bignews7.bellsouth.net>
Source record: 2109

Was wondering if anyone still uses a ST/e or Falcon, PC hardware emulator board.

And if anyone knows where I might find something like a message base past or present that would have some info on which software worked or works with the boards.

# 4442. Mega ST/Mega STE/TT Keyboards

Newsgroup: comp.sys.atari.st
Date: 2009-06-09 00:46:26 UTC

Source record: 2110

I'm looking for some good working keyboards
for the Mega ST, Mega STE and TT.

If you have one or more of these for sale/trade/give away,
contact me at phantomm@bellsouth.net

I have one in my little Falcon, a 286 board. Doesn't get used much any
more tho.

Only basic software that doesn't use colour VGA works on it iirc.

Mark

Hi Mark,

I've got one of those too.

If you don't mind me asking, Do you have a hard drive partition(s) for it,
or do you just use the disk drive?

Also what hard drive driver are you using if you have a boot partition?

>That's AWESOME. The AdSCSI alone is worth a mint!

It's NOT an adscsi. It's an adaptec 4000 something or other. I never knew such a thing existed? Maybe it's an MFM controller... I didn't look at the drives yet but it would kind of make sense given that they are like 10 and 20mb.
Either way, I'm totally stoked to have a little unmolested piece of history. There's even docs on there from the mid to late 80's. The setup, with quick ST and gdos and maxifile.. Priceless. It literally sat in this dude's basement for the last 19 years.
Thanks,
Mark

I would assume that speed is not important if you're still using an ST
;-) Being able to read and write USB sticks would be great, even if it's
slow.

Well, in "... would be great" we all agree, for sure :-) . I agree
too that speed is not so important for people using old Ataris.
But... if we can already have good speed with similar storage media:
Compact Flash card then I don't see that forcing USB Pen drive support
is something of priority. CF is more expensive than Pen drive, but
IDE IF is simpler than USB one, plus we have already drivers for it.
Price difference of medias is not so big, and 2GB CF card (for
instance) can hold couple thousands of Atari ST programs. With cheap
card reader for PC or MAC we can have simple and fast data transfer,
writing DL-ed stuff with PC on card for later usage on Atari. Hmm...
I forgot though that IDE IF attaching to Ataris is not quite an
option, due to lack of expansion port... But for non-electronic people
there is SD and Satan too :-)

Yep, was just about to say, with SatanDisk and UltraSatan, I'm not as concerned about a USB option. But...it would be nice to have - more options is always a good thing. :)

Can't wait for the UltraSatan to get here - 2 cards, hot swappable, and you can set a card to be PC compatible (although you lose on size) to swap data back and forth. Been using the SatanDisk with my STacy and it works very well. Righteous STuff. :)

Ok, ok... my fault : I omitted to add it concerns EtherNat.
We (who bought those very expensive boards) own a board that was
very promising, with 1 ethernet (actually working, but only using
MiNT OS) and 2 USB-2 ports.
Those who were lucky enough to receive their board(s) (some people
might not get theirs before next christmas) had to migrate to MiNT
in order to be able to use the ethernet, and the USB ports still
don't allow to run anything else that mice - where we were promised
memory sticks and other devices -.
I know, I wrote this already, but... I think this is really quite
frustrating : we bought a device that doesn't work half the way it
was announced to. :-(

# 4453. EtherNat problem

Newsgroup: comp.sys.atari.st
Date: 2009-06-09 17:47:09 UTC
From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <4a2ea01d$0$12617$ba4acef3@news.orange.fr>
Source record: 2120

Hello,

Still in trouble : one of my 2 EtherNats suddenly stopped working
a couple of weeks ago. First, it began to stop from time to time,
but then it definetely stopped. The 2 leds are lit, but no way to
find the route to hosts, nor ping, etc. - even inside my local
network -.
After I spent many hours trying to understand what was wrong, and
looking for supposed corrupted data on my disk, I finally replaced
it with the one on my second CT60'ed Falcon - the one I use as a
backup system -, and it worked.
So, I'm quite sure it's the board itself and not the software.
Maybe some component(s) being distressed ? But, then, I fear it
will happen to my second board too.
Does someone knows a way to test an find what may be wrong ?
Again, keep in mind that every obvious software test, except the
driver itself, has been done.

Regards,

J.-Luc

Folks, I know its an abbreviated month, but we're still gonna do a prize give-a-way. Courtesly of Techie_alison, we'll be giving away one of her updated PeST devices.

Whats a PeST? Its an interface that lets you use any PS2 mouse with your Atari ST.

More details/pictures here:

http://pest.atari.org/

Thanks and remember, you can't win if you don't call. :)

I saw that those projects are abandoned, went in public-domain
(published HW source files). Of course beause of small interest. It is
always like this when no some 'critical mass'. About undelivered
promises I really can not say something. Complain to people who
promised.
But I talk already for long time about SW, driver problem. Still, see
that people wants new HW, add-ons, interfaces. Then some new Atari
clones are announced, for pretty high prices... Don't see any reason
for optimism... Who will make drivers for those clones, still under
(hard) development.
As biggest problem among Atari people I see lack of realism. We must
be aware that we are very limited - in our count, in our real
possibilities for new developments. That making good SW, drivers, OS
improvements takes more time and effort than making HW. Do we now pay
price of massive piracy in past ? How to stimulate programmers ?

I see you are looking for keyboards. I have a Mega keyboard that I recrimped with an RJ45 plug. Good shape though. You can recrimp it with the standard 6 pin plug. Also, I have an extra TT keyboard. You and I are talking about both a Falcon and a BlowUp II on other channels. Maybe I can leverage the keyboards to wrangle some of what I want from you. =)

> Does HD Driver support this model?

It should, since there is no restriction on the SCSI devices supported
by the SCSI driver included in current versions of HDDRIVER. Just run an
ID check and check the termination in case the device is not found.
Also ensure that SCSI initiator identification is enabled and that the
drive does not have the same SCSI ID as the Falcon.
As far as the MegaSTE is concerned a LINK96/97 is required for some SCSI
devices. Some devices require the computer to have an SCSI ID of its own
(which is mandated by the SCSI standard) in order to work properly.

Hi Miro! Sorry for any confusion - at that prompt, just hit the <return>
key a few times - for some odd reason, what the user sees shows up a bit
differently on different OS's.

Thanks for calling! :)

I believe the Adaptec Controller is for MFM or RLL and you'll still need a
SCSI Host Adapter to make it work! It's hard to find MFM or RLL Hard Drives!

leed_public@hotmail.com wrote:
>That's AWESOME. The AdSCSI alone is worth a mint!

It's NOT an adscsi. It's an adaptec 4000 something or other. I never
knew such a thing existed? Maybe it's an MFM controller... I didn't look
at the drives yet but it would kind of make sense given that they are
like 10 and 20mb.
Either way, I'm totally stoked to have a little unmolested piece of
history. There's even docs on there from the mid to late 80's. The setup,
with quick ST and gdos and maxifile.. Priceless. It literally sat in
this dude's basement for the last 19 years.
Thanks,
Mark

> Can it be used as a replacement?

The STacy expects an input between 10.6 and 18VDC. (The STacy has a
'power low' light
that comes on around 11.5V. However, the STacy keeps running until
somewhere around 10.5V).

I experimented with the STacy in 2001 and made several posts in 2002
regarding powering the STacy with batteries. Here's a brief summary:

Don't use "C" cells! Atari and I both tried it, and it doesn't work
well (you get 15 minutes per charge). With some expensive high-
amperage cells you can get 30 minutes, but internal packs just don't
have enough juice!

However, a 12V cord to a 12V battery will work, but since the "power
low" light comes on at 11.5V you will have the "power low" light on
frequently. Also, you need to have a large enough battery to handle
the drain. Expect to use 2 - 3 Ah (Amp-Hours) of capacity for each
hour of use for large (auto-sized) batteries and 3 - 4 Ah of capacity
for smaller batteries due to the voltage drop. The commonly
available
"jumpstart" batteries typically hold 14 - 21 Ah and thus I'd suspect
that they'd work for several hours. (FWIW, I used a 40 pound 72 Ah
lead-acid wheelchair battery (13.8V) to power the STacy for several
years and managed over 24 hours a charge!)

Before I go, let me note that I'm going off of memory, although I'm
reasonably certain my numbers are accurate. Still, no warranties are
given or implied.

Galen

Hi Galen.

How much of a difference do you reckon it would make if the old stock LCD was replaced with a newer one, (DC of course), with low wattage reqs, and the internal hard drive was removed and replaced with something solid state like the SatanDisk or upcoming UltraSatan.

I'm just wondering if the original battery pack might actually be feasible then?

Thanks.

Great!
I have used the Compaq power unit (16V 2,5A) and it works great!!
Not too noisy, the display is a bit dark even with full brigthness, the trackball is better than the pads on the new laptops.

I have another question:
This Stacy has a 20Mb hard drive, and I have a 160Mb SCSI that I wanted to fit in...

The problem is that, even with all screws removed, I can't open the computer, something seems to maintain it around the Floppy+HD block.
It opens well around the keyboard, on the left side too, but not on the back right).
(I have removed the screws under the Stacy and the two on the back side). I don't want to break something!

And another other one:
The two ROM chips are really easy to reach, can you confirm that I could put a TOS 2.06 ??

Guillaume.

I agree with you, this Supercharger was really a good thing, nothing to open, just plug in the DMA port and run!
On my web page I also put some photos of the Supercharger 286 prototype that (as far as I know) has never been released to the public.

If you have a Supercharger to sell, I am interested... I could add, in this exchange, a FPU 8087 for your other Supercharger.

Guillaume.

The USB 2.0 chip I'd like to use is the NEC upd720101... (5 ports on PCI).
It is very well supported on linux and many PCI cards use it.

So, if somebody want to adapt linux driver on TOS, I'm ready to support him
by connecting the NEC chip to his atari !

Very good question : how to stimulate programmers ?

Except some exceptions, many people are stimulted with money.

So, maybe selling hardware may open the way to feedback a % of the hard to
the drivers authors ...

If tomorrow I sell an USB board for atari and assure a % of the price to an
author of the driver, will this run ?

If somebody is ready to develop here the USB driver and get money from me,
please contact me !

In a stunning reversal of fortune, I find myself needing to divest.
Add-Ons ARE NOT added on. They are separate and available as such.

Atari Falcon 030 14MB w/ power, aftermarket mouse (Amiga switchable),
RGB and VGA adapters
Atari 1040STe TOS 2.06/4MB w/ power, Atari Mouse
Atari TT030 w/ power, keyboard, aftermarket mouse
Atari TT030 w/ power, keyboard, Atari Mouse
Atari 130XE w/ power
Atari 1050 Disk Drive w/ power, SIO cable
Atari XF551 3.5" w/ power, SIO cable, and 5 1/4" mechanism and
original ROM
CT60 50mHz/128MB
Skunk Accelerator (the slower of the 2 models)
ICD AdSCSI ST
SIO2IDE
SIO2SD mounted inside XMM301 housing
12' S-Video cable for Atari 8-Bit
Atari RGB Video to SCART cable
NEC Multispin SCSI CDROM Drive (Top Loader) w/ power
NEC Multispin SCSI CDROM Drive (Caddy Loader) w/ power and caddy
DBA25 to 50Pin Centronix SCSI Cable x 3
50 Pin HD Male/Male SCSI II Cable

I will entertain offers from denizens of this forum for a week and
then post the items on eBay.

You really did a nice job with the web page. It looks like the daughter card
has memory. Is this added to the memory of the motherboard?

I have some old advertisements for a 486 version, but have no idea if it was
ever made or released.

Do you have the SuperCharger manual?
I have it if you need any info.

If I decide to get rid of one, I'll let you have first offer on it.

What versions of the software, utility disk do you have?

There is a version 1.5 utility disk which maybe labled 1.4 on the
disk label. afaik, this was last version???

btw, what did you use to get the black n white screen grabs of the software
that you have up on the web page?

The button for the disk drive could be catching on the case.
Those 2 screws on the back connect to a metal brace for the
floppy and hard drive.

iirc you also have to unplug 2 sets of wires located in the top part of the
monitor case and also unscrew a large green wire. If you want to take
the whole case off. The monitor screen will remain with the top case.
There is also a metal sheilding to remove to get to the MB.

Be careful when removing the keyboard. It has a plastic ribbon connection
with contacts. The keyboard just sits in there with this connection.

Pry open the monitor screen at the top edges and look inside and you'll see
the connectors.

.

# 4480. Changing HD on STACY

Newsgroup: comp.sys.atari.st
Date: 2009-06-13 09:24:08 UTC
From: Guillaume Tello <houten.van@orange.fr>
Message-ID: <4a336f6c$0$17747$ba4acef3@news.orange.fr>
Source record: 2148

Hello,

I have open (at last!) my STACY and wanted to change the HD.
I have a SCSI 160MB that runs well on the TT.
I put it into the STACY and get a strange problem :

when powered on, it signals a short-circuit! (is it the right word? I
mean that electricity is connected from + to -) and the alimentation
makes a caracteristical noise.
If I just unplug the power cord of the new HD, it's ok.

But this HD worked few minutes before!!!

On the main board I can read +5V, gnd, gnd, +12V and the four wires are
correctly directed to the same pins on the hard drive...

HELP !!!

Guillaume.

# 4481. Re: DVD Drive supported?

I was think it proably would. The bigger question is whether or not Extendos will support it. You might want to check out the Anodyne website and ask Roger about it. Sounds like it would though.

Source record: 2001

Problem might be parity. Stacy is no parity, and even drives with a no
parity jumper do not work some times. One work around, if you can build
small and neat, is a parity generator chip. If you can wire one of those
in, you can use a drive with parity.

I have one of those. I bought it with the intention of playing with it
in my Milan, but so far I haven't had the time to look into it. I don't
know much about USB at all, so I have no idea how much work a
stack/driver will require. A lot I guess ;-)

I'm looking at the Disk Label right now, there is no chameleon on the label!
It's an APX Title with an APX Manual with Rainbow Colors on the cover! It's
about a 26 page Manual!

Yeah.....I'll be buying one when....A) I have $800.00 USD to spare and
B) When I see how it actually fits inside a tower case, and how well
it runs exitsting Atari software.

Having said that, I am pretty excited about the project! I'm hopping
it really ignites the Atari community!! ::)

I guess that it is intended for some CT board. And will be not
usable with 'ordinary' Ataris as ST(E), stock Falcon, TT - because
that NEC chip is for PCI bus.
How about HW interfacing ? Do you have some literature about using
and interfacing PCI bus on CT, some Atari clone ?
All it is necessary for making driver...

ok, I found what I was looking for, there is more than 1 program with that
name.

btw Ben, do you have any new 5 1/4 floppy disks for use on a atari 1050
drive?

.

That's pretty nice (except prices :-) ). Question regarding USB usage: do you plan to use some existing, on market available PCI USB cards (with NEC chip), or you will make self some ? Then, considering that it will work only with PCI board: what is expected user base, how many people will really use it ? I ask it because of drivers, and chances that they will be made really ... I mean, it may be serious drawback for programmers. Choosing PCI USB. By using some more compatible USB solution, we could make driver usable on much more diverse Atari machines.

Actually I have 115 orders for CTPCI.
Yes I'd like to see a PCI-USB card driver available (
Nec uPD720101 is a good chip)...
Buit who want to do the driver (linux source are ok) ?

The price is what he has to be if you want I continue to design and spend so
much time on this activity...
Just the prototype cost 900 EUR !
Think about this.

I understand why prices are so big. But it will not help me to earn
money, especially not this crisy days :-)
Let's say that I want to write drivers. Then I need CT60/63. I need
PCI board... So, I must spend some hunderts of Euros now, to earn
maybe 2-3 times less Euros after couple years... It seems not as good
idea :-)
I don't care for Linux sources. I do everything in ASM for Atari. All
required info is available to make USB drivers. But it is really
complex thing, and big task. People talks about worth of 50000 $ for
such drivers. It is of course price for some firm, with all taxes,
etc. Still, I'm sure that making only drivers for PEN drives is at
least 100 hours of heavy work.
It would be better to do at once some universal driver, for wider
machine base. But likely it is just a dream, considering that we don't
have unique way of interfacing some faster USB on diverse Ataris. ACSI
port would be not good - Falcon has no it. Catch 22.

I don't think hardware drivers will be the major problem. Once the USB
stack exists, writing hardware drivers will (if the design is right)
not be that much work.

You speak like the atari domain is a business market....but it is just a fun domain.
No business here...
And it is why we have so few drivers authors...

I announced that I will propose a special price on CTPCI for developers who want to write something like a driver...
I cannot give hardware to them...
People who buy atari hardware to me know that they encourage me too...if I lost money what is the sense...?
Some people did some fantastic things on CT60 and just for fun & free...
On my next atari project I will try to furnish freely the hardware for a certain period of time and let choice after to the 'developer' to buy it at lower price or to send back.
It will be the better I will be able to do...

The USB driver on atari stills the biggest missing !
The EtherNAT has 2 USB ports but after 3 years we only can connect a mouse...
Not enough...
We need too keyboard, memory sticks, camera, external drives,....

I was skeptical at first, but the association ColdFire + FPGA makes the ACP board very powerful and extremely versatile ! It could be reprogrammed as a "hardware" emulator for virtually any older machine. The small size and the very low power consumption of the board certainly makes it suitable for a laptop.

Look at what this guy does with an original C64 board:
http://benheck.com/04-05-2009/commodore-64-original-hardware-laptop
Imagine such thing with the ACP board :-)

Bad choice because memory chips are very more expensive than DIMM modules
that are produced at very large scale.
Here they will buy some very small qty of memoru chip (DDR) and pay the max
price !

Very bad choice for final cost !

# 4524. WANTED: ATARI MEGA ST4!

Newsgroup: comp.sys.atari.st
Date: 2009-06-22 01:27:34 UTC

I'm Looking for an Atari Mega ST4. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade would be nice. Preferably the 6 Chip TOS set as laid out on the MotherBoard. The important feature is this. The built-in floppy must be the Chinon. You can tell, the drive has an eject button centered under the floppy slot. The button is wide, short height & slanted on both the left & right side. This Chinon Drive is the Most Common ST Disk Drive! And the case needs to be unaltered, not cut up to replace a drive with an incompatible eject button. Please direct All replies via E-Mail to Atari@aracnet.com or call Ben anytime (503)256-9974. I need to keep this Within the U.S. as far as this Mega ST goes.

Why insist on a Mega ST4? Why not a Mega ST2 upgraded to 4 Megs?. Answer: I had a Mega 2 upgraded to 4 Megs. The upgrade failed & I don't want that again. I don't care if Jack Tramiel himself upgraded it and Guaranteed it. I want the Mega to come that way from the factory. I don't trust most other peoples tech work. I'd rather have the RAM put in at the Factory.

Atari 8 Bit and ST Games/Software, Hardware/Accessories and Books/References! FREE Catalogs @ http://BenSells.Atari.org or http://BensCatalogs.Atari.org or Catalogs Requested by E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST or Both! Or Call Ben anytime at (503)256-9974!

There are free PCI LAN-drivers in FreeMiNT. They should - in theory! -
work fine with CTPCI as long as CTPCI has a Hades/Milan-compatible
PCIBIOS.

I have a PCI-card with a compatible chip somewhere which someday may make it into my Milan. My brief studies of USB suggests that only a small part of an USB solution will be hardware dependant. An USB stack with loadable hardware drivers will make it easy to support new hardware as long as documentation is available.

If you use a Hades/Milan-compatible PCIBIOS in CTPCI any driver should in theory be binary compatible. That would be easy to test using FreeMiNT and one of the PCI LAN-drivers :-)
